## ASSESSMENT DEVELOPMENT

## CHAPTER 1

## Developing the TIMSS 2019 Mathematics and Science Achievement Instruments

Kerry E. Cotter<br>Victoria A.S. Centurino<br>Ina V.S. Mullis

## Unique Characteristics of TIMSS 2019

The TIMSS assessments are designed to provide valid measurement of the mathematics and science content and skills that are valued by the international education community and included in the curricula of participating countries. The general approach to developing the TIMSS mathematics and science achievement items to meet this goal is similar from one assessment cycle to the next, but each cycle has some unique characteristics that influence instrument development. Besides providing measures on another cycle for the TIMSS trend lines monitoring changes in educational achievement since 1995, TIMSS 2019 also was remarkable for several reasons.

- TIMSS 2019 marked the beginning of the transition to eTIMSS—a digital version of TIMSS designed for computer- and tablet-based administration. eTIMSS offered an engaging, interactive, and visually attractive assessment that enabled TIMSS 2019 to better assess complex areas of the mathematics and science frameworks and increase operational efficiency in translation, assessment delivery, data entry, and scoring.
- As a part of the transition to digital assessment, eTIMSS 2019 included a series of extended Problem Solving and Inquiry (PSI) tasks in mathematics and science at both the fourth and the eighth grades. The eTIMSS PSIs were designed to simulate real world or laboratory situations in which students could integrate and apply process skills and content knowledge to solve mathematics problems or conduct virtual scientific experiments and investigations.
- Building on the success of TIMSS Numeracy 2015, the TIMSS 2019 assessment design was expanded to support a less difficult version of the fourth grade mathematics assessment that had some blocks of items in common with the regular fourth grade mathematics assessment. The less difficult version enabled TIMSS 2019 to provide improved measurement for participating countries where fourth grade students were still developing fundamental mathematics skills.

Results for the two versions of the fourth grade mathematics assessment were linked through the common items and reported on the same TIMSS achievement scale.

## Transitioning TIMSS to eTIMSS

Transitioning to digital assessment is important to "keep up with the times" and to increase both construct representation and data utility. Because not all TIMSS countries were prepared to conduct digital assessments, IEA decided to implement the transition over two assessment cycles—TIMSS 2019 and TIMSS 2023. More than half of the 64 countries participating in TIMSS 2019 elected to administer the "e" version of the assessments, while the rest of the countries administered TIMSS in paper-and-pencil format, as in previous assessment cycles (paperTIMSS).

The eTIMSS 2019 assessments included a variety of technology-enhanced item formats, with colorful graphics and interactive features. These features extended coverage of the mathematics and science frameworks and promoted student engagement. The digital mode of administration also allowed for a substantial proportion of the eTIMSS mathematics items to be machine scored.

The eTIMSS 2019 assessments were created and administered using IEA's eAssessment System, which houses a collection of online tools used for instrument creation, translation and adaptation, verification, delivery to students, scoring, and data entry. The digital mode of administration allowed eTIMSS to collect information about how students work through the items, such as screen-by-screen timing data and additional process variables that can be analyzed to study students' interactions with the achievement items.

The eTIMSS 2019 PSIs, designed exclusively for eTIMSS, were a new and pioneering effort to improve measurement of higher-order mathematics and science skills by capitalizing on the digital mode of administration. Each PSI consisted of a sequence of 4 to 16 items that were set in a cohesive context and addressed a range of topics from the TIMSS 2019 Assessment Frameworks (Mullis \& Martin, 2017), such as solving a series of mathematics problems to plan a school event or conducting a virtual scientific experiment to study plant growth. The items within these situational tasks included a broader array of innovative digital features than the regular eTIMSS achievement items and provided scaffolding for complex mathematics problems and science investigations.

## Less Difficult Mathematics at the Fourth Grade

For a variety of reasons, there are some countries where most children in the fourth grade are still developing fundamental mathematics skills. To offer countries the most effective assessment of fourth grade mathematics, IEA offers options for matching the TIMSS fourth grade mathematics assessment to the country's educational development and students' mathematics proficiency. For some countries, the less difficult version of the TIMSS 2019 fourth grade mathematics assessment was a better match with students' learning.

The TIMSS 2019 fourth grade assessment with less difficult mathematics was developed together with the regular fourth grade mathematics assessment and reflected the mathematics described in the TIMSS 2019 Mathematics Framework (Lindquist, Philpot, Mullis, \& Cotter, 2017). The regular and less difficult versions of the assessment were equivalent in scope, and about one-third of the items were the same between the two versions. The other two-thirds of the items in each version of the assessment addressed the same areas of the mathematics framework, but the items in the less difficult version involved less complex numbers and situations. The items in common between the two versions of the fourth grade mathematics assessment enabled the two assessments to be linked so that the results could be reported together and directly compared. Expert committees reviewed both the regular and less difficult mathematics items together at each phase of development.

The design of the TIMSS 2019 less difficult mathematics assessment improved upon the design of TIMSS Numeracy 2015, which was a stand-alone mathematics assessment that did not include science. For TIMSS 2019 at the fourth grade, countries could opt for either regular or less difficult mathematics, together with science. A substantial portion of the items in the less difficult version of the TIMSS 2019 mathematics assessment was carried forward from TIMSS Numeracy 2015, which enabled trend measurement for countries that participated in TIMSS Numeracy 2015.

## The TIMSS Approach to Measuring Trends

Because TIMSS is designed to measure trends, the assessments of mathematics and science cannot change dramatically from cycle to cycle. That is, TIMSS is based on a well-known premise for designing trend assessments (ascribed to John Tukey and Albert Beaton):
"If you want to measure change, do not change the measure."
However, the achievement items also need to be updated with each cycle to prevent the assessments from becoming dated and no longer relevant to current learning goals and policy issues. It is important that TIMSS reflects the most recent discoveries in the field and is presented in ways consistent with students' instructional and everyday experiences.

To maintain continuity with past assessments while keeping up with current topics and technology, the TIMSS assessments evolve with each cycle. TIMSS has a specific design for rotating items out of the assessment after each cycle and replacing them with newly developed items for the following cycle. The remaining achievement items, referred to as "trend items," are kept secure to be re-administered in subsequent cycles. With this design for item replacement, each TIMSS assessment includes items from three cycles-newly developed items, items from the previous cycle, and items from two cycles before.

## Overview of the TIMSS 2019 Achievement Items

Although the majority of the TIMSS achievement items are carried forward from the previous assessment cycle to measure trends, the task of updating the instruments for each new cycle-every four years since 1995-is a substantial undertaking. Because TIMSS assesses two subjects at two grades, it actually encompasses five different assessments of achievement-regular and less difficult mathematics at the fourth grade, mathematics at the eighth grade, and science at the fourth and eighth grades.

The TIMSS 2019 fourth grade assessments required developing and field testing 261 new mathematics and science items in both digital and paper formats as well as 66 new paper-based items for the less difficult version of the mathematics assessment. The TIMSS 2019 eighth grade assessments required developing and field testing 325 new mathematics and science items in both digital and paper formats. For eTIMSS 2019, the field test also included eight mathematics and science PSI tasks at the fourth grade and seven mathematics and science PSI tasks at the eighth grade.

Since the beginning in 1995, the TIMSS assessments have included two general item formats: selected response (i.e., questions to which students choose their answer(s) from a set of options) and constructed response (i.e., questions to which students construct their own responses). For each constructed response item, a unique scoring guide is developed along with the item with clear distinctions among correct, incorrect, and, if applicable, partially correct answers. The format of each item is chosen based on the mathematics or science content and cognitive domain being assessed.

## The Item Development Process

The TIMSS \& PIRLS International Study Center at Boston College employs a collaborative process inspired by the principles of the evidence-centered design framework (ECD; Mislevy, Almond, \& Lukas, 2003) to develop the new achievement items needed for each TIMSS cycle. With this approach, validity is supported by adhering to best practices in assessment design throughout the development process-namely, clearly defining the target construct to be measured, specifying the items needed to measure it, establishing standards for items and test forms, and ensuring that the assessments meet the test specifications. A broad overview of this process to support coherence between the assessment goals and data includes:

- Updating the assessment frameworks to identify and prioritize the mathematics and science content and skills that the assessment will measure
- Developing achievement items as well as scoring guides for constructed response items to meet the assessment specifications delineated in the frameworks
- Conducting a full-scale field test to evaluate the measurement properties of the item pool and practice the data collection and scoring procedures
- Selecting the new items to meet the assessment specifications based on the field test results and trend items from previous cycles
- Conducting training in how to reliably score students' responses to constructed response items to ensure the quality of the data

The development process is directed and managed by the staff of the TIMSS \& PIRLS International Study Center, who collectively have considerable experience in the measurement and assessment of mathematics and science achievement. For TIMSS 2019, Executive Director, Ina Mullis, and Assistant Director of Mathematics, Kerry Cotter, managed the mathematics assessment development. Executive Director, Michael Martin, and Assistant Director of Science, Victoria Centurino, managed the science assessment development.

Also playing a key role in achievement item development were the TIMSS 2019 National Research Coordinators (NRCs) designated by their countries to be responsible for the complex tasks involved in implementing TIMSS in their countries. The TIMSS \& PIRLS International Study Center worked with the NRCs and experts from the participating countries to update the assessment frameworks and develop the new achievement items, including the scoring guides for constructed response items. The NRCs reviewed the items prior to the field test and helped select the items for the assessment after the field test.

The TIMSS \& PIRLS International Study Center prepared an international version of all the TIMSS achievement items in English. Subsequently, the items were translated by participating countries into their languages of instruction with the goal of creating high quality translations that were appropriately adapted for the national context and at the same time remained internationally comparable. Therefore, a significant portion of the NRCs' development and review effort was dedicated to ensuring that the achievement items could be translated accurately.

Additional advice and guidance was provided through periodic reviews by the TIMSS 2019 Science and Mathematics Item Review Committee (SMIRC). SMIRC members for each TIMSS cycle are nominated by countries participating in TIMSS and provide guidance in developing the TIMSS assessments. The TIMSS 2019 SMIRC consisted of 13 members: 7 experts in mathematics and mathematics education and 6 experts in science and science education.

SMIRC members met four times for TIMSS 2019. At the $1^{\text {st }}$ TIMSS 2019 SMIRC meeting in Amsterdam, The Netherlands (April 2017), the committee reviewed the mathematics and science content frameworks and initial drafts of the mathematics and science PSIs. At the $2^{\text {nd }}$ meeting in Windsor, England (September 2017), SMIRC reviewed draft field test items, together with the scoring guides for constructed response items. At the $3{ }^{\text {rd }}$ meeting in Tromsø, Norway (July 2018), SMIRC reviewed field test results and made recommendations regarding the items to include in the TIMSS 2019 mathematics and science assessments. At the final meeting in Singapore (May 2020), SMIRC conducted the TIMSS 2019 scale anchoring process (see Using Scale Anchoring to Interpret the TIMSS 2019 Achievement Scales). Exhibit 1.1 lists the TIMSS 2019 SMIRC members.

Developing the PSIs and technology-enhanced achievement items to meet the ambitious development goals for eTIMSS 2019 necessitated even more expert review and collaboration than previous TIMSS cycles. Several SMIRC members worked closely with staff at the TIMSS \& PIRLS International Study Center throughout the development process to achieve these goals. For mathematics, Mary Lindquist and Ray Philpot provided additional subject-matter expertise and support. For science, Emily Jones, Christopher Lazzaro, and Berenice Michels served in this capacity.

## The TIMSS 2019 Development Schedule

In preparation for the transition to eTIMSS, development work for TIMSS 2019 began over three years before the TIMSS 2019 Field Test and included a series of novel activities to develop the eTIMSS user interface, eAssessment System, and PSIs. Essentially, the first two years were devoted to updating the assessment frameworks and pilot testing the mathematics and science PSIs and trend items in digital format. The third year was dedicated to writing new achievement items in both digital and paper format, continuing to refine the PSIs, and testing components of the eAssessment System to ensure successful delivery of eTIMSS across a variety of digital devices and testing conditions.

The TIMSS 2019 Field Test was conducted from March through May 2018. After a thorough review of the results, the materials for data collection were finalized in August 2018. TIMSS 2019 Data Collection began in the Southern Hemisphere in September 2018 and continued in the Northern Hemisphere through May 2019.

Exhibit 1.2 shows the TIMSS 2019 development schedule for the achievement items beginning with initial work on the eAssessment System through TIMSS 2019 Data Collection.

Exhibit 1.2: TIMSS 2019 Development Schedule for Achievement Items

| Date(s) | Group and Activity |  |
| :--- | :---: | :--- |
| January | 2015 | TIMSS \& PIRLS International Study Center and IEA Hamburg began designing the <br> eTIMSS assessment system, user interface, and digital item types, including the PSIs, <br> in preparation for the transition to eTIMSS |
| March | 2015 | TIMSS \& PIRLS International Study Center began work with members of the Science <br> and Mathematics Item Review Committee (SMIRC), other external expert consultants, <br> and IEA Hamburg to design and operationalize prototype PSIs |
| August | 2015 | Consultants and staff at the TIMSS \& PIRLS International Study Center began drafting <br> additional PSIs for both the fourth and eighth grade assessments (Boston, USA) |
| August | 2015 | American Institutes for Research (AIR) conducted cognitive laboratories for two <br> prototype PSIs (one fourth grade mathematics and one eighth grade science) and a <br> sample of TIMSS trend items converted to digital format |
| October | Consultants and staff at the TIMSS \& PIRLS International Study Center reviewed the <br> results of the cognitive laboratories, continued revising the draft PSIs, and drafted new <br> PSIs (Boston, USA) |  |
| June 2016 | TIMSS \& PIRLS International Study Center presented an informational video <br> introducing the features of the eTIMSS assessments and debuting the PSIs to National <br> Research Coordinators (NRCs) (8 ${ }^{\text {th }}$ NRC meeting-Quebec, Canada) |  |
| June-September | 2016 | TIMSS \& PIRLS International Study Center conducted content analysis of the <br> curricular topics described in the TIMSS 2015 Encyclopedia and proposed updates to <br> the mathematics and science frameworks for TIMSS 2019 |
| September | SMIRC reviewed the draft TIMSS 2019 Assessment Frameworks and provided <br> feedback to staff at the TIMSS \& PIRLS International Study Center. The staff then met <br> with SMRIC consultants to incorporate SMIRC's comments (Boston, USA) |  |

Exhibit 1.2: TIMSS 2019 Development Schedule for Achievement Items (continued)

| Date(s) |  | Group and Activity |
| :---: | :---: | :---: |
| October | 2016 | Australia, Canada, and Singapore administered the eTIMSS prePilot, which included a sample of trend items converted to digital format and draft PSIs |
| November | 2016 | Consultants and staff at the TIMSS \& PIRLS International Study Center reviewed the results of the eTIMSS prePilot and revised the PSIs and user interface specifications based on these results. The group also drafted one additional PSI for each grade, fulfilling the development requirements for the eTIMSS 2019 Field Test (Boston, USA) |
| February | 2017 | NRCs reviewed the draft TIMSS 2019 Assessment Frameworks (1st NRC meetingHamburg, Germany). Following the meeting, NRCs completed an online survey to provide feedback as to whether each topic area should be kept as is, modified, or deleted |
| March-April | 2017 | TIMSS \& PIRLS International Study Center prepared draft TIMSS 2019 Item Writing Guidelines, including specific guidelines for the enhanced item formats available for eTIMSS. Staff also revised the draft TIMSS 2019 Assessment Frameworks based on feedback from NRCs |
| April | 2017 | SMIRC reviewed the draft TIMSS 2019 Assessment Frameworks, TIMSS 2019 Item Writing Guidelines, and PSIs (1st TIMSS 2019 SMIRC meeting-Amsterdam, The Netherlands) |
| May | 2017 | NRCs reviewed the TIMSS 2019 Assessment Frameworks and developed draft field test items and scoring guides using the TIMSS 2019 Item Writing Guidelines (2 ${ }^{\text {nd }}$ NRC meeting-Hamburg, Germany) |
| May | 2017 | The eTIMSS Pilot/Item Equivalence Study, designed to investigate mode effects for the TIMSS trend items, was conducted to provide information about the robustness of the eAssessment System and countries' readiness to conduct a digital assessment |
| July | 2017 | Consultants and staff at the TIMSS \& PIRLS International Study Center reviewed and revised draft field test items and scoring guides, including PSIs (Boston, USA) |
| September | 2017 | SMIRC reviewed the draft field test items and scoring guides, including PSIs (2 ${ }^{\text {nd }}$ SMIRC meeting-Windsor, England) |
| September | 2017 | Consultants and staff at the TIMSS \& PIRLS International Study Center reviewed the updated field test items and PSIs and refined the scoring guides with special attention to machine scoring (Boston, USA) |
| November | 2017 | NRCs reviewed and approved the TIMSS 2019 Field Test instruments (3 $3^{\text {rd }}$ NRC meeting-Melbourne, Australia) |
| December | 2017 | TIMSS \& PIRLS International Study Center and IEA Hamburg assembled all TIMSS 2019 Field Test instruments and released the international instruments to countries for translation |
| January-March | 2018 | TIMSS \& PIRLS International Study Center and IEA Hamburg collaborated to establish specifications for eTIMSS data capture and machine-scored constructed response items |
| January | 2018 | TIMSS \& PIRLS International Study Center collected student responses to constructed response items from English-speaking countries to develop scoring training materials for the field test |
| January | 2018 | Consultants and staff at the TIMSS \& PIRLS International Study Center reviewed the field test scoring guides and prepared scorer training materials (Boston, USA) |
| March-May | 2018 | Countries conducted the TIMSS 2019 Field Test |

Exhibit 1.2: TIMSS 2019 Development Schedule for Achievement Items (continued)

| Date(s) |  | Group and Activity |
| :---: | :---: | :---: |
| March | 2018 | NRCs received scoring training for constructed response field test items (4 $4^{\text {th }}$ NRC meeting-Madrid, Spain) |
| May | 2018 | Countries submitted TIMSS 2019 Field Test achievement data for analysis and review |
| May | 2018 | NRCs provided feedback to the TIMSS \& PIRLS International Study Center about the field-tested PSIs. Based on the NRC's evaluations, the TIMSS \& PIRLS International Study Center selected the PSIs to move forward to eTIMSS 2019 Data Collection and began editing the tasks based on NRC feedback |
| June | 2018 | IEA Hamburg completed data processing and TIMSS \& PIRLS International Study Center completed scoring of machine-scored items |
| June | 2018 | TIMSS \& PIRLS International Study Center reviewed the field test item statistics and assembled sets of proposed items for data collection |
| July | 2018 | SMIRC reviewed the proposed items for data collection in conjunction with the field test results (3rd SMIRC meeting-Tromsø, Norway) |
| August | 2018 | NRCs reviewed and approved the proposed item blocks for TIMSS 2019 Data Collection ( $5{ }^{\text {th }}$ NRC meeting-Stockholm, Sweden) |
| September | 2018 | TIMSS \& PIRLS International Study Center and IEA Hamburg finalized all TIMSS 2019 Data Collection instruments and released the international instruments to countries for translation |
| SeptemberDecember | 2018 | Southern Hemisphere countries conducted TIMSS 2019 data collection |
| September | 2018 | Consultants and staff at the TIMSS \& PIRLS International Study Center reviewed and updated scoring guides and scorer training materials (Boston, USA) |
| November | 2018 | NRCs from Southern Hemisphere countries received scoring training for constructed response items (Cape Town, South Africa) |
| November | 2018 | TIMSS \& PIRLS International Study Center finalized scoring guides and training materials for constructed response items and distributed them to NRCs from Southern Hemisphere countries |
| March | 2019 | NRCs from Northern Hemisphere countries received scoring training for constructed response items (Limassol, Cyprus) |
| March-June | 2019 | Northern Hemisphere countries conducted TIMSS 2019 data collection |

## Updating the Assessment Frameworks for TIMSS 2019

The first step in developing the TIMSS achievement instruments is to define and prioritize the mathematics and science content and skills that the assessment will measure. The assessment frameworks cannot drastically change from cycle to cycle, but are routinely updated to keep up with fresh ideas and current information about curricula, standards, and instruction in mathematics and science education around the world. The first two chapters of the TIMSS 2019 Assessment Frameworks (Mullis \& Martin, 2017), respectively, describe the mathematics and science frameworks in detail.

## Writing and Reviewing the TIMSS 2019 Field Test Items and Scoring Guides

The TIMSS 2019 Field Test included approximately one and a half times the number of achievement items needed for data collection, to ensure a sufficient number of high quality items for the TIMSS 2019 assessments. In all, about 800 items were field tested. With the exception of the PSIs (eTIMSS only) and less difficult mathematics items (paper only), all items were prepared and administered in both digital and paper format. These items were designed to be identical in content across eTIMSS and paperTIMSS, with the only difference being the response mode (e.g., a drag and drop item in eTIMSS may be a matching item in paperTIMSS).

The TIMSS \& PIRLS International Study Center uses a collaborative process involving the participating countries to develop the substantial number of new items and scoring guides needed for the field test. Most of the $2^{\text {nd }}$ TIMSS 2019 NRC meeting in Hamburg, Germany was devoted to a workshop for developing the field test items. The NRCs, together with experienced item writers from participating countries and staff from the TIMSS \& PIRLS International Study Center, drafted the majority of the new items for the mathematics and science field tests during this workshop.

In preparation for the item writing workshop, staff at the TIMSS \& PIRLS International Study Center identified the scope of the item writing task for the field test. Considerations included the total items needed based on the weight assigned to a particular topic in the TIMSS 2019 Assessment Frameworks (Mullis \& Martin, 2017), as well as how many items existed from previous assessments. The TIMSS \& PIRLS International Study Center also updated the item writing manual specifically developed for TIMSS assessments. The manual contains general information about procedures for obtaining good measurement of mathematics and science achievement (e.g., items must be independent and not provide clues to the correct responses of other items), as well as specific information on how to deal with translation and comparability issues (e.g., using TIMSS' fictitious unit of currency, the "zed," for items involving money). The manual also includes the necessary steps for developing scoring guides for constructed response items, as well as checklists for reviewing TIMSS items.

Updated for the transition to eTIMSS, the TIMSS 2019 Item Writing Guidelines provided additional instructions for taking advantage of the technology-enhanced item formats-drag and drop, sorting, selection, drop-down menus, and a line drawing tool. These guidelines included examples of how each enhanced item format might be used (e.g., using drag and drop for adding labels to graphs or diagrams) and some details about the functionality of the formats (e.g., the maximum number of "draggable" parts available in a drag and drop item).

At the TIMSS 2019 Item Writing Workshop, country representatives were divided into teams and given specific item writing assignments based on their areas of expertise to ensure that enough field test items were developed for each of the content areas and cognitive processes specified in the frameworks.

Staff from the TIMSS \& PIRLS International Study Center used the TIMSS 2019 Item Writing Guidelines to provide training to the teams on item writing procedures. The teams were asked to provide a complete draft of each item they developed, including the content topic and cognitive area from the framework that the item addressed and the information needed to score the item (i.e., an answer key for selected response items or scoring guide for constructed response items). Once teams had completed their own item writing assignments, they reviewed the items drafted by other teams. In addition, some teams continued to send items to the TIMSS \& PIRLS International Study Center for several weeks after the Item Writing Workshop.

Exhibit 1.3 shows the number of participants in the TIMSS 2019 Item Writing Workshop and the approximate number of items written.

Exhibit 1.3: TIMSS 2019 Item Writing Workshop to Develop Field Test Items

## Participants

| Number of Countries and Benchmarking Entities | 53 |
| :--- | :---: |
| Number of Country Representatives | 118 |
| Approximate Number of Field Test Items Written at |  |
| Item Writing Workshop |  |
| Fourth Grade Mathematics | 300 |
| Fourth Grade Science | 200 |
| Eighth Grade Mathematics | 300 |
| Eighth Grade Science | 200 |

Following the item writing workshop, staff at the TIMSS \& PIRLS International Study Center reviewed each item in light of the framework specifications and selected an optimal group of items for further review and revision. Consultants from the Australian Council for Educational Research (ACER) and the National Foundation of Educational Research (NFER) drafted additional mathematics and science items, respectively, to improve coverage of areas of the frameworks that are especially challenging to measure.

In July 2017, several SMIRC members with particular item writing skills met with staff from the TIMSS \& PIRLS International Study Center to continue revising the draft field test items. SMIRC then reviewed all of the proposed draft field test items at the $2^{\text {nd }}$ TIMSS 2019 SMIRC meeting. After SMIRC's review, the items were revised again, and the NRCs reviewed the complete set of draft field test items at the $3^{\text {rd }}$ TIMSS 2019 NRC meeting in Melbourne, Australia. Following this meeting, staff at the TIMSS \& PIRLS International Study Center implemented the final suggested revisions and provided the international versions of the field test instruments in digital or paper format to the NRCs so that they could begin translating the field test materials into their languages of instruction.

## Preparing eTIMSS Field Test Items for Digital Delivery

Preparing the eTIMSS field test items for digital delivery required the additional step of entering each item into IEA's Item Builder, a web-based application for creating digital achievement items and instruments for delivery to students via computers and tablets. For eTIMSS 2019, the Item Builder included templates for both traditional (e.g., standard multiple-choice) and enhanced (e.g., drag and drop) item formats as well as a variety of tools for designing the items, such as features for uploading and adding text to images, creating tables, and previewing items as they would appear to students during the field test. After drafting and reviewing the field test items on paper, staff at the TIMSS \& PIRLS International Study Center entered all eTIMSS items into the Item Builder and collaborated with IEA Hamburg to conduct extensive quality control tests to ensure each item would appear and function as intended for students.

## Developing Problem Solving and Inquiry (PSIs) Tasks for eTIMSS

In many ways, PSI development work followed the standard TIMSS procedures for ensuring that the items provide valid measurement of the TIMSS 2019 Assessment Frameworks (Mullis \& Martin, 2017). However, because the PSIs involved a new and more innovative approach to assessing mathematics and science achievement in a digital environment, PSI development required additional efforts.

Developing engaging problem contexts with cohesive sets of achievement items necessitated even more rounds of expert review than is typical for TIMSS items. Staff at the TIMSS \& PIRLS International Study Center began collaborating with SMIRC members to develop the PSIs in March 2015, nearly two years before item writing for the rest of the TIMSS 2019 items began. Several SMIRC members worked closely with TIMSS staff to develop the PSIs, which included providing initial ideas for the tasks and participating in a series of meetings to develop and refine the problem contexts, items, and scoring guides.

Leading up to the field test, several SMIRC members and staff at the TIMSS \& PIRLS International Study Center met a total of five times at Boston College and conducted many online reviews to refine the PSIs. SMIRC as a whole conducted its first in-depth review of the PSIs at the $1^{\text {st }}$ TIMSS 2019 SMIRC meeting, which focused on the alignment between the tasks and the frameworks, the extent to which the technology in the tasks supported the intended response processes, and the cross-cultural appropriateness of the problem scenarios. The NRCs reviewed the PSIs prior to the field test at the $3^{\text {rd }}$ TIMSS 2019 NRC meeting.

In addition to extensive expert review, cognitive laboratories and a pilot test were conducted in several eTIMSS countries in advance of the field test to gain insight into students' interactions with the PSIs and to test the functionality of the eAssessment System. This strand of development work provided critical information about the usability of innovative item types and the eTIMSS interface, the amount of time it took students to complete each task, and the approximate difficulty of the tasks. Following each
outing and review, improvements were made to both the PSIs and their software with the aim of eliciting the intended types of responses from students.

## eTIMSS Cognitive Laboratories

Staff at the TIMSS \& PIRLS International Study Center partnered with the American Institutes for Research (AIR) to conduct cognitive laboratories in the very early stages of the transition to eTIMSS (August 2015). The goal of this study was to investigate two aspects of digital assessment that would inform next steps in eTIMSS development: students' interactions with drafts of the first PSIs, and students' experiences with the eTIMSS interface.

The TIMSS \& PIRLS International Study Center prepared two prototype PSIs and a set of TIMSS trend items in digital format at each grade, along with a list of research questions, from which AIR developed interview protocols. During the interviews, students explained their thoughts while engaging with the items on tablets, providing insight into how the PSI format and eTIMSS interface could be improved.

AIR conducted the interviews with a purposive sample of 32 fourth and eighth grade students from the greater Washington, D.C. area. Following the interviews, AIR prepared a report to address each of the TIMSS \& PIRLS International Center's research questions. The reports from the cognitive laboratories prompted substantial revisions to the PSI item format and the eTIMSS interface. In particular, the students reported difficulties in using a stylus to write or draw, so the device keyboards were enabled for items requiring a written response and a new tool for drawing lines was developed.

## eTIMSS prePilot

The eTIMSS prePilot was conducted in September 2016 to collect more information on students' interactions with the draft PSIs and eTIMSS interface in a standard testing situation. The prePilot instruments included a total of 12 PSI tasks across both subjects and grades and incorporated a broader variety of interactive features and item types than the first prototypes. The instruments also were designed to be administered on both computers and tablets to accommodate a wider range of devices and support more countries' participation in eTIMSS.

The eTIMSS prePilot was conducted in three English-speaking countries with experience in conducting digital assessments: Australia, Canada, and Singapore. Each country selected two to four classes at each grade to participate and made efforts to include students with a range of mathematics and science ability. This sample yielded approximately 100 responses per item at both the fourth and the eighth grade.

Students' responses to the draft PSIs and participating countries' reports on their experiences carrying out the study prompted additional changes to both the PSIs and their software before the field test.

## The TIMSS 2019 Field Test

In preparation for data collection, TIMSS routinely conducts a full-scale field test for the purposes of evaluating the measurement properties of the item pool and practicing the data collection and scoring procedures. For TIMSS 2019, the field test was a particularly critical "dress rehearsal" because it was the first large-scale administration of eTIMSS on computers and tablets. In addition to providing important information about how well each prospective item and PSI functioned, the field test results prompted a number of improvements to the components in the eAssessment System as well as to the directions for test administrators and students.

All eTIMSS and paperTIMSS materials and operational procedures were field tested with samples of students selected according to rigorous sampling procedures. The field test in each country was designed to be conducted in approximately 30 schools and yield at least 200 student responses to each mathematics and science item. The school samples for the TIMSS 2019 Field Test and Data Collection were drawn simultaneously, using the same random sampling procedures. This ensured that the field test samples closely approximated the data collection samples, and that a school was selected for either the field test or data collection, but not both. For example, if a country needed 150 schools for data collection and another 30 for the field test, then a larger sample of 180 schools was selected and a systematic sample of 30 schools was selected for the field test from the 180 schools. See Chapter 3 for details about the school and classroom sampling techniques used in TIMSS 2019.

Preparing for the eTIMSS 2019 Field Test was quite complicated and involved several additional steps beyond those included in paperTIMSS. After translating and adapting the international instruments in IEA's online translation system, countries checked the functionality of their national instruments, loaded the eTIMSS Player software onto each computer or tablet to be used in the field test, and checked the compatibility of the software with the devices. Following each testing session, test administrators uploaded students' responses to IEA's servers.

Exhibit 1.4 shows the total number of items in each fourth and eighth grade field test, as well as the number of students, teachers, and schools that participated. Exhibits 1.5 through 1.8 provide a detailed summary of the number of field test items in the eTIMSS and paperTIMSS field tests by format, content domain, and cognitive domain.

Exhibit 1.4: Overview of the TIMSS 2019 Field Test

|  | Fourth Grade |  |  | Eighth Grade |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | eTIMSS | paperTIMSS | Less Difficult Mathematics | eTIMSS | paperTIMSS |
| Items in Field Test |  |  |  |  |  |
| Mathematics | 174 | 127 | 130 | 201 | 158 |
| Science | 164 | 134 | 134 | 212 | 167 |
| Total | 338 | 261 | 264 | 413 | 325 |
| Responses per Item per Country (approx.) | 200 | 200 | 200 | 200 | 200 |
| Participants |  |  |  |  |  |
| Countries | 31 | 18 | 7 | 22 | 14 |
| Benchmarking Entities | 6 | - | - | 5 | - |
| Students | 50,158 | 19,656 | 8,128 | 37,512 | 16,225 |
| Teachers | 3,337 | 1,176 | 471 | 5,009 | 1,826 |
| Schools | 1,340 | 526 | 203 | 852 | 342 |

Counts for eTIMSS include the items from the PSI tasks.
Five item blocks ( 64 items) were common to both the regular and less difficult fourth grade mathematics assessment.

## Exhibit 1.5: TIMSS 2019 Number of Field Test Items by Content Domain and Item Format Fourth Grade

| Content Domain | Number of Selected Response Items | Number of Constructed Response Items | Total Number of Items | Percentage of Total Items |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics - eTIMSS and paperTIMSS |  |  |  |  |
| Number | 27 | 25 | 52 | 40\% |
| Measurement and Geometry | 22 | 20 | 42 | 32\% |
| Data | 15 | 22 | 37 | 28\% |
| Total | 64 | 67 | 131 |  |
| Mathematics - Less Difficult |  |  |  |  |
| Number | 31 | 24 | 55 | 42\% |
| Measurement and Geometry | 21 | 17 | 38 | 29\% |
| Data | 17 | 20 | 37 | 28\% |
| Total | 69 | 61 | 130 |  |
| Science - eTIMSS and paperTIMSS |  |  |  |  |
| Life Science | 40 | 22 | 62 | 46\% |
| Physical Science | 28 | 13 | 41 | 31\% |
| Earth Science | 18 | 13 | 31 | 23\% |
| Total | 86 | 48 | 134 |  |

Four mathematics items were only field tested in eTIMSS and four items were only field tested in paperTIMSS. Counts include all eight of these items.
Five item blocks ( 64 items) were common to both the regular and less difficult fourth grade mathematics assessments.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

## Exhibit 1.6: TIMSS 2019 Number of Field Test Items by Cognitive Domain and Item Format - Fourth Grade

| Cognitive Domain | Number of Selected Response Items | Number of Constructed Response Items | Total Number of Items | Percentage of Total Items |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics - eTIMSS and paperTIMSS |  |  |  |  |
| Knowing | 29 | 14 | 43 | 33\% |
| Applying | 27 | 38 | 65 | 50\% |
| Reasoning | 8 | 15 | 23 | 18\% |
| Total | 64 | 67 | 131 |  |
| Mathematics - Less Difficult |  |  |  |  |
| Knowing | 36 | 11 | 47 | 36\% |
| Applying | 25 | 30 | 55 | 42\% |
| Reasoning | 8 | 20 | 28 | 22\% |
| Total | 69 | 61 | 130 |  |
| Science - eTIMSS and paperTIMSS |  |  |  |  |
| Knowing | 42 | 16 | 58 | 43\% |
| Applying | 28 | 17 | 45 | 34\% |
| Reasoning | 16 | 15 | 31 | 23\% |
| Total | 86 | 48 | 134 |  |

Four mathematics items were only field tested in eTIMSS and four items were only field tested in paperTIMSS. Counts include all eight of these items.
Five item blocks ( 64 items) were common to both the regular and less difficult fourth grade mathematics assessments.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

Exhibit 1.7: TIMSS 2019 Number of Field Test Items by Content Domain and Item Format - Eighth Grade

| Content Domain | Number of Selected Response Items | Number of Constructed Response Items | Total Number of Items | Percentage of Total Items |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics - eTIMSS and paperTIMSS |  |  |  |  |
| Number | 18 | 28 | 46 | 29\% |
| Algebra | 25 | 28 | 53 | 34\% |
| Geometry | 9 | 22 | 31 | 20\% |
| Data and Probability | 14 | 14 | 28 | 18\% |
| Total | 66 | 92 | 158 |  |
| Science - eTIMSS and paperTIMSS |  |  |  |  |
| Biology | 42 | 19 | 61 | 36\% |
| Chemistry | 22 | 16 | 38 | 23\% |
| Physics | 24 | 13 | 37 | 22\% |
| Earth Science | 24 | 7 | 31 | 19\% |
| Total | 112 | 55 | 167 |  |

Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.
Exhibit 1.8: TIMSS 2019 Number of Field Test Items by Cognitive Domain and Item Format Eighth Grade

| Cognitive Domain | Number of Selected Response Items | Number of Constructed Response Items | Total Number of Items | Percentage of Total Items |
| :---: | :---: | :---: | :---: | :---: |
| Mathematics - eTIMSS and paperTIMSS |  |  |  |  |
| Knowing | 28 | 19 | 47 | 30\% |
| Applying | 32 | 46 | 78 | 49\% |
| Reasoning | 6 | 27 | 33 | 21\% |
| Total | 66 | 92 | 158 |  |
| Science - eTIMSS and paperTIMSS |  |  |  |  |
| Knowing | 46 | 12 | 58 | 35\% |
| Applying | 39 | 23 | 62 | 37\% |
| Reasoning | 27 | 20 | 47 | 28\% |
| Total | 112 | 55 | 167 |  |

Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

The eTIMSS 2019 Field Test also included eight mathematics and science PSI tasks at the fourth grade, comprising 72 items, and seven mathematics and science PSI tasks at the eighth grade, comprising 83 items. Because the PSIs were designed with the distinct goals of increasing coverage of traditionally difficult to measure areas of the mathematics and science frameworks in the applying and reasoning cognitive domains by capitalizing on technology, choices about the content topics to assess with each task were largely guided by the problem contexts and potential uses of technology to enhance measurement. Following the field test, two-thirds of the PSI tasks were selected for data collection (see Exhibit 1.18 for a description of the selected tasks).

## Developing the Materials for TIMSS 2019 Field Test Scoring Training

To ensure the quality of the TIMSS assessment results, it is critical that students' responses to the achievement items demonstrate the knowledge, application, or reasoning in mathematics or science required by the item to receive credit. It also is critical that students' responses are evaluated consistently to enable comparisons of students' mathematics and science achievement across countries and over time. For these reasons, TIMSS expends considerable effort to ensure the validity and reliability of the scores assigned to students' responses to the TIMSS achievement items.

In addition to developing a unique scoring guide for each constructed response item, the TIMSS \& PIRLS International Study Center provided training for the NRCs and their scoring supervisors to ensure that the scoring guides for all human-scored constructed response items were applied consistently within and across countries. The TIMSS 2019 training materials consisted of sets of student responses for a selected group of items with the most complicated scoring guides. For each item, the training set consisted of 8 to 12 student responses illustrating the codes in the scoring guide (example responses) followed by 8 to 12 student responses without pre-assigned score codes (practice responses).

To allow for field test scoring to begin immediately upon completion of data collection, it was necessary to prepare scoring training materials for the newly developed constructed response items in advance of the field test. To provide "grist" for these materials, Australia, England, and Ireland pilot tested a selection of the newly developed constructed response field test items in several classrooms with English-speaking students in January 2018. Because students may express their answers in different ways when typing versus writing by hand, both typed and handwritten responses were collected for the all items in both the eTIMSS and paperTIMSS assessments.

Exhibit 1.9 provides the number of items included in the pilot test and the number of student responses collected. Only a small number of mathematics items required scoring training, so the majority of the items in the pilot were in science.

Exhibit 1.9: Pilot Test Student Responses for Field Test Scoring Training Materials Development

|  | Number of Items | Approximate Number of Responses |  |
| :---: | :---: | :---: | :---: |
|  |  | eTIMSS | paperTIMSS |
| Fourth Grade |  |  |  |
| Mathematics | 5 | 93 | 96 |
| Science | 21 | 93 | 96 |
| Countries |  | England | Australia and Ireland |
| Eighth Grade |  |  |  |
| Mathematics | 6 | 80 | 43 |
| Science | 19 | 80 | 43 |
| Countries |  | England | Ireland |

Consultants and staff at the TIMSS \& PIRLS International Study Center met in January 2018 to review responses collected in the pilot test and create the training materials. For the TIMSS 2019 Field Test, training sets of example and practice responses were created for a total of 23 fourth grade items and 30 eighth grade items. These sets included both typed and handwritten responses to prepare scorers to score student responses in both modes of administration.

The TIMSS 2019 NRCs and their scoring supervisors received scoring training for the field test in March 2018 in Madrid, Spain, as part of the $4^{\text {th }}$ TIMSS 2019 NRC meeting. At the training sessions, the trainers explained the purpose of each item and read it aloud. The trainer then described the scoring guide, explaining each category and the rationale for the score given to each example paper. The country representatives were then given time to score the practice papers so they could apply the scoring guides and learn how to make distinctions among categories. The correct codes for each practice paper were then reviewed, any inconsistencies in scoring were discussed, and, as necessary, the scoring guides were clarified and sometimes categories were revised.

## Finalizing the TIMSS 2019 Achievement Instruments

Subsequent to the field test, the TIMSS \& PIRLS International Study Center analyzed the TIMSS field test data and selected the new items to be combined with the trend items for data collection. When selecting the items, both the measurement properties (item statistics) of the individual items and the overall content and cognitive domain coverage of the group of items were considered to ensure that the final achievement instruments met the assessment specifications in the frameworks.

To review the measurement properties of the field test items, staff at the TIMSS \& PIRLS International Study Center prepared almanacs containing summary item statistics for each field test item. The achievement data almanacs displayed for each item, row by row for each country: the number
of students to whom the item was administered, the item difficulty and discrimination, the percentage of students answering each option (selected response) or in each score category (constructed response), the point-biserial correlation for each selected response option or constructed response category, and the degree of scoring agreement for human-scored constructed response items. The field test data were used by the TIMSS \& PIRLS International Study Center, expert committees, and NRCs to assess the quality of the field test items.

First, staff at the TIMSS \& PIRLS International Study Center reviewed the field test data to make an initial judgment about the quality of each item based on its measurement properties. Items were eliminated from further consideration if they had poor measurement properties, such as being too difficult or too easy or having low discrimination. Particular attention was paid to unusual item statistics in individual countries because these could indicate errors in translation.

After the item-by-item review, staff at the TIMSS \& PIRLS International Study Center collaborated with a subset of SMIRC members to choose a set of recommended achievement items. The group reviewed the viable field test items for each content domain topic in relation to the trend items to select a coherent group of items for each topic, then verified that the set of items were appropriately distributed across the cognitive domains and item formats. SMIRC scrutinized the recommendations for the newly developed achievement items at the $3^{\text {rd }}$ TIMSS 2019 SMIRC meeting, reviewing the items and scoring guides for content accuracy, clarity, and adherence to the frameworks.

To allow for any major revisions to the PSIs to be completed in time for data collection, the NRCs were asked to provide feedback on the PSIs when they submitted their field test data. Staff at the TIMSS \& PIRLS International Study Center reviewed all NRC comments in conjunction with the data, selected the PSIs for the eTIMSS 2019 assessments based on the NRCs' recommendations, and began editing the selected tasks in June 2018. SMIRC also reviewed the PSIs at their $3^{\text {rd }}$ meeting.

Next, staff at the TIMSS \& PIRLS International Study Center implemented SMIRC's recommendations and assembled the items into assessment blocks for the NRCs' penultimate review. The NRCs had the opportunity to review the recommended assessment blocks in light of the field test results and within the security of their own countries. Each country also could check any unusual national results that might be indicative of translation errors and correct the translation as necessary or recommend revisions to better accommodate translation. Finally, the $5^{\text {th }}$ TIMSS 2019 NRC meeting held in Stockholm, Sweden, in August 2018 was devoted to reviewing all the newly developed items.

Following the final review, the newly developed item blocks and existing trend item blocks were arranged into digital block combinations for eTIMSS and booklets for paperTIMSS according to the TIMSS 2019 Assessment Design (Martin, Mullis \& Foy, 2017). For eTIMSS, the trend item blocks were converted from paper to digital format to be administered via the eAssessment System along with the new item blocks. The results of the TIMSS 2019 Item Equivalence Study (Fishbein, Martin, Mullis, \&

Foy, 2018), a pilot conducted in 25 eTIMSS countries to investigate potential differences in student achievement on the trend items between the paper and digital modes of administration, provided evidence that the mathematics and science constructs assessed by the trend items were mostly unaffected in the transition to eTIMSS at both grades. Still, to ensure that the eTIMSS and paperTIMSS results could be reported on the same achievement scale, eTIMSS 2019 countries that had participated in TIMSS 2015 also re-administered the trend items in paper booklets to a nationally representative sample of students during data collection to provide a "bridge" between paperTIMSS and eTIMSS (see Chapter 12 for additional details).

## Distribution of the TIMSS 2019 Achievement Items

It is critical to document the coherence between the assessment frameworks and achievement instruments to ensure that an assessment measures what it is intended to measure and provide evidence for the validity of the assessment results. Because the TIMSS assessments encompass two domains (content and cognitive) and include both trend and newly developed items in a variety of formats, it is necessary to demonstrate the alignment between the items and assessment specifications from multiple perspectives.

## Achievement Items by Content and Cognitive Domain

The TIMSS 2019 assessments consisted of approximately 40 percent new items and 60 percent trend items, which were used to continue trend measurement from the previous assessment cycles. Therefore, it is important to confirm that the distribution of both the trend and new items across the content and cognitive domains reflects the specifications described in the assessment frameworks. The distribution of the trend items typically varies from the target specifications because the assessment frameworks are updated with each cycle and items are "retired" from the assessment, so the new items are selected to ensure the final assessments are aligned with the frameworks.

Exhibits 1.10 and 1.11 present the number of trend and newly developed items as well as the number of score points in the TIMSS 2019 fourth grade assessments by content domain and cognitive domain, respectively. The number of items represents the number of distinct questions in the assessment, while the number of score points represents the complexity and weight given to each item. Exhibits 1.12 and 1.13 present the TIMSS 2019 eighth grade assessments by content and cognitive domain.

Exhibit 1.10: TIMSS 2019 Achievement Items by Content Domain - Fourth Grade

| Content Domain | Trend |  | New |  | Total |  | Target Percentage of Score Points |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number of Items | $\begin{aligned} & \text { Percentage } \\ & \text { of Score } \\ & \text { Points } \end{aligned}$ | Number of Items | Percentage of Score Points | Number of Items | Percentage of Score Points |  |
| Mathematics - eTIMSS and paperTIMSS |  |  |  |  |  |  |  |
| Number | 55 (59) | 61\% | 29 (30) | 32\% | 84 (89) | 47\% | 50\% |
| Measurement and Geometry | 26 (27) | 28\% | 27 (31) | 33\% | 53 (58) | 31\% | 30\% |
| Data | 11 (11) | 11\% | 27 (32) | 34\% | 38 (43) | 23\% | 20\% |
| Total | 92 (97) |  | 83 (93) |  | 175 (190) |  |  |
| Mathematics - Less Difficult |  |  |  |  |  |  |  |
| Number | 67 (68) | 59\% | 29 (32) | 42\% | 96 (100) | 52\% | 50\% |
| Measurement and Geometry | 31 (34) | 29\% | 20 (21) | 28\% | 51 (55) | 29\% | 30\% |
| Data | 13 (14) | 12\% | 19 (23) | 30\% | 32 (37) | 19\% | 20\% |
| Total | 111 (116) |  | 68 (76) |  | 179 (192) |  |  |
| Science - eTIMSS and paperTIMSS |  |  |  |  |  |  |  |
| Life Science | 44 (47) | 46\% | 34 (36) | 46\% | 78 (83) | 46\% | 45\% |
| Physical Science | 36 (37) | 36\% | 26 (26) | 33\% | 62 (63) | 35\% | 35\% |
| Earth Science | 18 (18) | 18\% | 17 (17) | 22\% | 35 (35) | 19\% | 20\% |
| Total | 98 (102) |  | 77 (79) |  | 175 (181) |  |  |

Score points are shown in parentheses.
Two mathematics items involving an on-screen ruler tool were only included in eTIMSS assessment.
Four item blocks (48 items) were common to both the regular and less difficult fourth grade mathematics assessments.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

Exhibit 1.11: TIMSS 2019 Achievement Items by Cognitive Domain - Fourth Grade

| Cognitive Domain | Trend |  | New |  | Total |  | Target Percentage of Score Points |

| Total | 122 (133) |  | 98 (110) |  | 220 (243) |  |  |

Score points are shown in parentheses.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

## Achievement Items by Item Formats within Content and Cognitive Domains

To assess the broad range of mathematics and science topics and skills described in the assessment frameworks, the TIMSS 2019 fourth and eighth grade assessments included a wide variety of selected response and constructed response items. Both the digital and paper versions of the TIMSS 2019 assessments included two general types of selected response items-single selection, in which students choose one of four response options, and multiple selection, in which students chose more than one option from a number of response options or made a series of selections to respond to a question. In eTIMSS, the answer options for some selected response items were presented in drop-down menus or as clickable pictures or words. Most TIMSS 2019 selected response items were worth one score point, although some multiple selection items were worth two score points. The 2-point multiple selection items were scored as fully correct (all parts answered correctly; 2 score points), partially correct (most parts answered correctly; 1 score point), or incorrect (few or no parts answered correctly; 0 score points).

Constructed response items, which involve writing or typing words or numbers, drawing, or dragging and dropping for eTIMSS, were worth one or two score points depending on the degree of complexity involved. The 1-point constructed response items were scored as correct ( 1 score point) or incorrect ( 0 score points), whereas 2-point constructed response items were scored as fully correct (2 score points), partially correct ( 1 score point), or incorrect ( 0 score points). Fully correct responses show a complete or deeper understanding of a task while partially correct responses demonstrate only a partial understanding of the concepts or procedures embodied in the task.

To ensure sufficient coverage of the assessment frameworks, it is important to verify that an assortment of selected and constructed response items are used to assess each domain. Exhibits 1.14 through 1.17 display the number of items (and score points) by item format for each content and cognitive domain in the fourth and eighth grade assessments.

Exhibit 1.14: TIMSS 2019 Achievement Items by Content Domain and Item Format - Fourth Grade

| Content Domain | Selected Response Items |  | Constructed Response Items |  | Total Items | Percentage of Score Points |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Single Selection | Multiple Selection | 1 Point | 2 Points |  |  |
| Mathematics - eTIMSS and paperTIMSS |  |  |  |  |  |  |
| Number | 39 (39) | 7 (7) | 33 (33) | 5 (10) | 84 (89) | 47\% |
| Measurement and Geometry | 25 (25) | 6 (6) | 17 (17) | 5 (10) | 53 (58) | 31\% |
| Data | 8 (8) | 3 (3) | 22 (22) | 5 (10) | 38 (43) | 23\% |
| Total | 72 (72) | 16 (16) | 72 (72) | 15 (30) | 175 (190) |  |
| Achieved Percentage of Score Points | 46\% |  | 54\% |  |  |  |
| Mathematics - Less Difficult |  |  |  |  |  |  |
| Number | 46 (46) | 1 (1) | 45 (45) | 4 (8) | 96 (100) | 52\% |
| Measurement and Geometry | 26 (26) | 2 (2) | 19 (19) | 4 (8) | 51 (55) | 29\% |
| Data | 10 (10) | 2 (3) | 16 (16) | 4 (8) | 32 (37) | 19\% |
| Total | 82 (82) | 5 (6) | 80 (80) | 12 (24) | 179 (192) |  |
| Achieved Percentage of Score Points | 46\% |  | 54\% |  |  |  |
| Science - eTIMSS and paperTIMSS |  |  |  |  |  |  |
| Life Science | 35 (35) | 6 (7) | 33 (33) | 4 (8) | 78 (83) | 46\% |
| Physical Science | 35 (35) | 5 (5) | 21 (21) | 1 (2) | 62 (63) | 35\% |
| Earth Science | 24 (24) | 4 (4) | 7 (7) | -- | 35 (35) | 19\% |
| Total | 94 (94) | 15 (16) | 61 (61) | 5 (10) | 175 (181) |  |
| Achieved Percentage of Score Points | 61\% |  | 39\% |  |  |  |

Score points are shown in parentheses.
Two fourth grade mathematics items involving an on-screen ruler tool were only included in eTIMSS assessment.
Four item blocks (48 items) were common to both the regular and less difficult fourth grade mathematics assessments.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.

Exhibit 1.15: TIMSS 2019 Achievement Items by Cognitive Domain and Item Format - Fourth Grade

| Cognitive Domain | Selected Response Items |  | Constructed Response Items |  | Total Items | Percentage of Score Points |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Reasoning | 21 (21) | 5 (6) | 28 (28) | 4 (8) | 58 (63) | 26\% |
| Total | 115 (115) | 24 (30) | 64 (64) | 17 (34) | 220 (243) |  |

Achieved Percentage of Score Points

Score points are shown in parentheses.
Because percentages are rounded to the nearest whole number, some totals may appear inconsistent.
eTIMSS Problem Solving and Inquiry Tasks (PSIs) by Content and Cognitive Domain
Exhibit 1.18 provides a brief description of the eTIMSS 2019 PSI problem scenarios and the total number of items (and score points) in each task. The tasks covered a range of mathematics and science content domain topics and, consistent with the goal of the PSIs to assess higher-order skills, the majority of the items in the PSIs involved applying and reasoning.

Exhibit 1.18: eTIMSS 2019 Mathematics and Science Problem Solving and Inquiry Tasks (PSIs)

| Fourth Grade PSIs | Total Items |
| :---: | :---: |
| Mathematics |  |
| School Party - Students plan a party for a school by determining the price for tickets and the amount of food, drinks, and decorations to purchase for the party | 11 (14) |
| Robots - Students use a robot that can follow input-output rules to solve mathematics problems and determine the robot's rules | 6 (7) |
| Little Penguins - Students add information to a website about Little Penguins by solving a series of mathematics problems involving facts about penguins | 12 (14) |
| Science |  |
| Farm Investigation - Students carry out a virtual investigation to identify the farm animal responsible for eating garden plants | 10 (16) |
| Sugar Experiment - Students design and carry out a virtual experiment to test which of three types of sugar dissolves fastest in water | 9 (13) |
| Eighth Grade PSIs | Total Items |
| Mathematics |  |
| Dinosaur Speed - Students use the relationships between foot length, leg height, and stride length to estimate how fast a dinosaur could run | 12 (13) |
| Building - Students determine the dimensions of a shed to store equipment, including a barrel to collect rainwater | 9 (11) |
| Robots - Students determine functions using a robot that applies a function to determine $y$ for any given value of $x$ | 4 (4) |
| Science |  |
| Sunken Ship - Students carry out a virtual investigation into the circumstances that resulted in the sinking of a ship | 16 (17) |
| Pepper Plants - Students design and carry out a virtual experiment to test the effects of two fertilizers on the growth and development of pepper plants | 13 (18) |

Score points are shown in parentheses.

The addition of the PSIs for eTIMSS resulted in a slight increase in coverage of the applying and reasoning cognitive domains at both the fourth and the eighth grade. However, comprising only a small part of the whole assessment (approximately 12 percent), the PSIs did not substantially alter the framework coverage provided by the eTIMSS assessments. The pie charts in Exhibits 1.19 and 1.20 show the percentage of assessment score points in each content and cognitive domain in the eTIMSS 2019 assessments, both with and without the PSIs included, compared to the target percentage of testing time allocated to each domain.

## Exhibit 1.19: Comparison of Target and Achieved Percentages of Domain Coverage in the eTIMSS 2019 Mathematics and Science Assessments - Fourth Grade

Target percentage of testing time specified in the frameworkAchieved percentage of score points from regular items
Achieved percentage of score points from regular and PSI items

Exhibit 1.20: Comparison of Target and Achieved Percentages of Domain Coverage in the eTIMSS 2019 Mathematics and Science Assessments - Eighth GradeTarget percentage of testing time specified in the framework
Achieved percentage of score points from regular items
Achieved percentage of score points from regular and PSI items

## TIMSS 2019 Constructed Response Scoring Training

In preparation for the main data collection scoring training, some TIMSS 2019 scoring guides were further refined or clarified based on the results of the field test. This also included a thorough review of the field test scoring training materials to ensure that the student responses were still suitable for the updated scoring guides. In some cases, example and practice sets used in the field test were expanded to further illustrate particular aspects of a scoring guide.

The TIMSS 2019 scoring training materials also included the training sets for the trend items used in TIMSS 2015. These training materials were updated for TIMSS 2019 to include both typed and handwritten responses. In all, the TIMSS 2019 scoring training materials included sets of example and practice responses for a total of 26 fourth grade items and 27 eighth grade items.

To provide scoring training for all the countries participating in TIMSS 2019, the TIMSS \& PIRLS International Study Center conducted two training sessions. First, the NRCs for Southern Hemisphere countries and their scoring supervisors received scoring training in November 2018 in Cape Town, South Africa. The NRCs for Northern Hemisphere countries and their scoring supervisors received scoring training in March 2019 in Limassol, Cyprus as part of the $6^{\text {th }}$ TIMSS 2019 NRC meeting. Exhibit 1.21 shows the number of participants in the two scoring training sessions.

Exhibit 1.21: TIMSS 2019 Scoring Training Participation

| Participants | Southern <br> Hemisphere | Northern <br> Hemisphere |
| :--- | :---: | :---: |
| Number of Countries | 7 | 52 |
| Number of Benchmarking Entities | - | 5 |
| Number of Country Representatives | 24 | 150 |

After participating in scoring training, the NRCs and their scoring supervisors organized and carried out scoring activities in their respective countries. In addition to scoring the student responses, all countries participated in several supplementary scoring activities to document the scoring reliability of the human-scored items. The procedures used to establish scoring reliability within each country, across countries, and across assessment cycles are described in Survey Operations Procedures for TIMSS 2019.

## The Process Following Instrument Development

After the participating countries received the international version of the achievement instruments, they began the process of translation and cultural adaptation (some adaptation to local usage typically is necessary even in English-speaking countries) and production of the materials needed to administer the assessment. The tasks involved in producing the materials differed depending on whether eTIMSS or paperTIMSS was being administered. At the same time, countries made final arrangements for data collection, including the host of activities necessary to obtain school participation and implement test administration.

## CHAPTER 2

## Updating the TIMSS 2019 Instruments for Describing the Contexts for Student Learning

Ina V.S. Mullis
Bethany Fishbein

## Introduction

Beginning with the first TIMSS assessments in 1995, each TIMSS assessment cycle has collected an array of information from each participating country about the national, home, school, and classroom contexts in which students learn mathematics and science. The purpose for collecting these data is to learn more about the educational factors that are related to mathematics and science achievement by examining these factors internationally across and within countries. The fundamental idea is for countries to learn from each other about possible ways to improve their own education systems.

Considering countries' mathematics and science achievement together with the factors that can facilitate that achievement is at the core of TIMSS. Collecting comparable data across countries about students' opportunities for learning mathematics and science is as central to TIMSS as collecting comparable data about students' mathematics and science achievement.

The areas of the student learning contexts addressed in the TIMSS 2019 context questionnaire instruments were described in the TIMSS 2019 Context Questionnaire Framework. Because TIMSS has been administered every four years since 1995, making TIMSS 2019 the seventh TIMSS administration, many aspects of collecting the contextual data have become relatively stable across cycles. Similar to previous TIMSS assessments, in TIMSS 2019:

- The home, school, teacher, and student context questionnaires were administered together with the mathematics and science assessments
- Substantial portions of the TIMSS 2019 International Results in Mathematics and Science were devoted to reporting the data collected via the home, school, teacher, and student
questionnaires in relation to countries' achievement on the mathematics and science assessments
- The TIMSS 2019 Encyclopedia was based on countries' responses to the TIMSS 2019 Curriculum Questionnaire and each country wrote a chapter for the Encyclopedia describing its mathematics and science curricula and general education policies
- Many of the topics covered in the context questionnaires and the information provided by countries for their chapters in the TIMSS 2019 Encyclopedia were similar to those in previous assessments, although updated for TIMSS 2019.

## Description of the TIMSS 2019 Context Questionnaires

This section describes the TIMSS 2019 Home, School, Teacher, Student, and Curriculum Questionnaires, including who was responsible for completing each questionnaire, the content covered, and the method for administering the questionnaire. The TIMSS 2019 context questionnaires can be viewed in their entirety on the TIMSS 2019 Context Questionnaires webpage.

## Home Questionnaire

The Home Questionnaire (also known as the "Early Learning Survey") was administered at the fourth grade to the students' parents or guardians. It asked about home resources for fostering literacy and numeracy skills, the parents' highest level of education, employment situations, opinions about their child's school, their child's attendance in preprimary education programs, the emphasis on literacy and numeracy activities in the home before the child attended school (such as reading books, singing songs, writing words and numbers, and counting), and the level of their child's literacy and numeracy skills when beginning school. Countries asked students' parents or guardians to complete the questionnaire online or sent it to the students' homes in paper-and-pencil format.

## School Questionnaire

The School Questionnaire was administered at the fourth and eighth grades to the principals of the students' schools. It asked about the level of students' literacy and numeracy skills when they first enter the school, the availability of instructional resources, the socioeconomic background of the students attending the school, the school's emphasis on academic success, the need for discipline, and the principals' education. Countries administered the questionnaire either online or via paper-and-pencil.

## Teacher Questionnaires

A single version of the Teacher Questionnaire was administered at the fourth grade to students' teachers, given that generally the same teachers taught the students both mathematics and science. At the eighth grade, there were separate versions of the questionnaire for the students' mathematics teachers and the students' science teachers. The questionnaires asked about the teachers' education, professional development, and career satisfaction as well as about students' readiness for instruction, the frequency they do various instructional activities, difficulties in providing instruction, curriculum topics covered, assessment practices, and availability of computers for instruction. Countries administered the Teacher Questionnaire either online or via paper-and-pencil.

## Student Questionnaire

Administered to all students at the fourth and eighth grades, the Student Questionnaire asked students about their educational experiences at home and school related to learning mathematics and science. It also included several scales about their attitudes toward learning mathematics and science. At the eighth grade, there were two versions of the questions about science-one for countries that taught science as an integrated subject and one for countries where science was taught as separate subjects (e.g., biology, earth science, chemistry, and physics). The separate science questionnaire asked some of the questions for each content area individually. Regardless of whether they were participating in eTIMSS or paperTIMSS, students were administered a paper-and-pencil questionnaire at the end of their testing session.

For countries that participated in eTIMSS, students also answered several questions on their digital devices at the end of the assessment about their experience taking the eTIMSS assessment and their familiarity with digital devices.

## Curriculum Questionnaire

The Curriculum Questionnaire was administered at the fourth and eighth grades to the National Research Coordinators (NRCs) of the participating countries. This questionnaire collected information about national curriculum policies and practices related to the countries' educational systems and the organization and content of the mathematics and science curricula in their country. The Curriculum Questionnaire was administered online.

## Maintaining Continuity with Previous Assessments

Much of the information in the TIMSS 2019 context questionnaires was collected in the form of context questionnaire scales (typically including 8-12 items) that measure particular factors or constructs that have been found to be related to mathematics and science achievement as assessed by TIMSS. Many of the scales included in the TIMSS 2019 questionnaires were brought forward from 2015 because they
addressed home and school factors that have been of interest for several assessment cycles. These scales either were brought forward in their entirety or modified for the 2019 cycle.

The following existing scales were included in the Home Questionnaire:

- Home Resources for Learning
- Home Early Literacy and Numeracy Activities Before Primary School
- Could Do Early Literacy and Numeracy Tasks When Beginning Primary School
- Parents' Perceptions of Their Child's School

Existing scales included in the School Questionnaire covered:

- Instruction Affected by Resource Shortages
- School Emphasis on Academic Success (also included in the Teacher Questionnaire)
- School Discipline
- Schools Where Students Entered Primary Grades with Literacy and Numeracy Skills

Existing scales included in the Teacher Questionnaire covered:

- School Emphasis on Academic Success (also in the School Questionnaire)
- Safe and Orderly School
- Teachers' Job Satisfaction
- Classroom Teaching Limited by Students Not Ready for Instruction

The following existing scales were included in the Student Questionnaire:

- Student Bullying
- Sense of School Belonging

TIMSS 2019 also continued the long-standing practice of asking students about their attitudes toward mathematics and science, primarily via the following scales:

- Students Like Learning Mathematics
- Students Like Learning Science
- Students Confident in Mathematics
- Students Confident in Science
- Students Value Mathematics
- Students Value Science

Other topics also were brought forward to TIMSS 2019 from previous assessments. Collecting information about the curriculum has been central to TIMSS from the beginning, and TIMSS 2019 continued this by asking countries to describe their mathematics and science curricula in the curriculum questionnaire and in their chapters for the TIMSS 2019 Encyclopedia. The chapters detailed each country's nationally specified (or formal) curricula in mathematics and science (sometimes called the intended curriculum by TIMSS). To collect information about students' opportunity to learn the country's curriculum, the teachers of the TIMSS students were asked which TIMSS topics had been covered during the current or previous school years.

Teacher education policies and practices also have been of continued interest across assessment cycles. TIMSS 2019 asked countries to describe the education and credentialing procedures for becoming a teacher in the Curriculum Questionnaire and professional development requirements and programs were described in the Encyclopedia chapters. The Teacher Questionnaire asked teachers themselves about their education degrees, areas of concentrated study while earning their degrees, and participation in professional development after becoming a teacher.

## Updates to the TIMSS 2019 Context Questionnaires and Encyclopedia Chapters

Although a number of scales and questions were brought forward from TIMSS 2015, the TIMSS 2019 Home, School, Teacher, and Student Questionnaires as well as the Curriculum Questionnaire and the outline for the countries' Encyclopedia chapters were updated to address important areas of current research, such using digital devices in mathematics and science instruction. Considering recommendations from the participating countries about the most useful information to collect, TIMSS 2019 had three main goals for improving the context questionnaires: 1) enhancing the measures of teacher instructional quality, 2) addressing areas relevant to using technology in instruction and assessment, and 3) reducing the response burden for teachers.

TIMSS 2019 focused on scales of teacher instructional quality based on students' reports. New items were written for the Student Questionnaire to enhance existing measures aligned with research about "instructional clarity." To address the topic of classroom management, a new scale was developed asking students about the extent disorderly behavior occurs in their mathematics lessons. New items in the Student Questionnaire also asked about how often teachers use instructional activities related to problem solving and inquiry, such as conducting science experiments.

With more than half the participating countries transitioning to eTIMSS, TIMSS 2019 renewed efforts to collect data about technology use for instruction and assessment. The School Questionnaire asked principals about the availability of technology resources, such as digital learning resources (e.g.,
digital books). Teachers were asked about using computers to support students in mathematics and science lessons, and whether students take mathematics and science tests on digital devices. To cover additional questionnaire topics relevant to digital assessment, students who took eTIMSS answered questions about their familiarity with using digital devices for schoolwork.

New items for the Home Questionnaire improved coverage for early numeracy activities and skills, such as drawing shapes and measuring quantities. The Student Questionnaire scale at the eighth grade about students' bullying experiences also was revamped to better reflect the current trends related to social media and cyberbullying. The new scale included a greater emphasis on bullying experienced through digital devices.

Based on feedback from NRCs and in response to high rates of teacher nonresponse in several TIMSS 2015 countries, several items and scales that were given a lower priority were retired from the Teacher Questionnaire, including those asking about school working conditions, collaborating with other teachers, and confidence in teaching the curriculum.

TIMSS 2019 also retired some content to reduce the burden for NRCs. Several topics were moved from the Encyclopedia chapters to the Curriculum Questionnaire, including the countries' language(s) of instruction, additional education requirements for mathematics and science teachers, and the first grade of schooling taught by subject specialist teachers. Several topics deemed to be outdated were deleted from the Curriculum Questionnaire, such as policies for student tracking and the process for approving instructional materials.

## Overview of the Updating Process

With each new assessment cycle, the TIMSS \& PIRLS International Study Center at Boston College follows a collaborative and iterative process to update the TIMSS data collection instruments for the contexts for learning mathematics and science. For TIMSS 2019, Executive Directors Ina Mullis and Michael Martin and TIMSS Questionnaire Coordinator Martin Hooper (through 2018) led the development process, which involved updating the questionnaires from 2015, conducting several iterations of review, and a full-scale field test. Based on the field test results, minor revisions were made to the questionnaires and final reviews were conducted prior to data collection.

The National Research Coordinators (NRCs) who were designated by the participating countries to be responsible for implementing TIMSS 2019 played a key role in reviewing the TIMSS 2019 context questionnaires. They provided feedback and proposed new topics at NRC meetings throughout the development process, including at the first TIMSS 2019 NRC meeting, as well as the NRC meetings before the field test and prior to TIMSS 2019 Data Collection.

The TIMSS 2019 Questionnaire Item Review Committee (QIRC) consisted of NRCs with experience and expertise in education policy analysis and survey development. Members of QIRC made major
contributions in updating the TIMSS 2019 Context Questionnaire Framework and in modifying and developing the context questionnaires. This included conducting an online review and attending two committee meetings-a first meeting prior to the field test and a second meeting prior to data collection. The members of the TIMSS 2019 QIRC are listed in Exhibit 2.1.

## Reviewing the Field Test Results for the TIMSS 2019 Context Questionnaires

The field test is an important step for assessing the quality of the home, school, teacher, and student questionnaire instruments and measurement scales before data collection. Particularly for newly developed items, this step in the updating process also gives countries' an opportunity to ensure the items are appropriately translated and adapted to their national contexts so that their data are internationally comparable (see Chapter 5: Instrument Translation and Layout Verification for TIMSS 2019).

Subsequent to conducting the TIMSS 2019 Field Test, the TIMSS \& PIRLS International Study Center analyzed the field test data, consisting of responses from: 1) 66,626 parents or caregivers to the Home Questionnaire, 2) 2,682 principals to the School Questionnaire, 3) 10,993 teachers to the Teacher

Questionnaire, and 4) 121,454 students to the Student Questionnaire. The staff at the TIMSS \& PIRLS International Study Center produced data almanacs containing item statistics for each questionnaire item, including the percentage of students responding to each response option, with the corresponding average student achievement in mathematics or science, respectively. The staff also prepared context questionnaire scale summaries to evaluate the suitability of the items for scaling with one parameter item response theory (Rasch) model. The scales were evaluated for unidimensionality, reliability, and their relationship with achievement. More information about the TIMSS 2019 context questionnaire scales and their measurement properties can be found in Chapter 16: Creating and Interpreting the TIMSS 2019 Context Questionnaire Scales.

The TIMSS \& PIRLS International Study Center reviewed the field test results and updated the questionnaires as necessary for the final round of reviews by the TIMSS 2019 QIRC and NRCs. The next section contains the complete schedule of activities included in the updating process.

## Schedule of Activities for Updating the TIMSS 2019 Instruments for Describing Contexts for Student Learning

Exhibit 2.2 presents the schedule for updating the TIMSS 2019 instruments used to collect information about students' home, school, and classroom contexts for learning mathematics and science. The iterative review process formally began in February 2017 at the $1^{\text {st }}$ TIMSS 2019 NRC meeting and ended with finalizing the Curriculum Questionnaire in April 2019.

Exhibit 2.2: TIMSS 2019 Schedule of Activities for Updating Context Questionnaires

| Date(s) | Group and Activity |  |
| :--- | :---: | :--- |
| February | 2017 | NRCs reviewed the TIMSS 2015 context questionnaires, providing ideas for new topics <br> that should be addressed in TIMSS 2019 (1st NRC meeting-Hamburg, Germany) |
| February-June | 2017 | TIMSS \& PIRLS International Study Center drafted the TIMSS 2019 Context <br> Questionnaire Framework incorporating NRC feedback |

| Date(s) |  | Group and Activity |
| :---: | :---: | :---: |
| November | 2017 | NRCs reviewed the draft field test home, school, teacher, and student questionnaires (3 ${ }^{\text {rd }}$ NRC meeting-Melbourne, Australia) |
| NovemberDecember | 2017 | TIMSS \& PIRLS International Study Center finalized the field test home, school, teacher, and student questionnaires, incorporating suggestions from the NRCs |
| December | 2017 | TIMSS \& PIRLS International Study Center provided the TIMSS 2019 field test questionnaires to the NRCs for translation |
| March-May | 2018 | Countries conducted TIMSS 2019 Field Test |
| April-May | 2018 | Countries submitted field test data to IEA Hamburg for review |
| May-June | 2018 | TIMSS \& PIRLS International Study Center analyzed the field test data and reviewed the results |
| July | 2018 | QIRC reviewed questionnaires together with the field test results and proposed revisions to the home, school, teacher, and student questionnaires. QIRC also reviewed the draft TIMSS 2019 Curriculum Questionnaire and Encyclopedia chapter outline (2 $2^{\text {nd }}$ QIRC meeting-Oslo, Norway) |
| July-August | 2018 | TIMSS \& PIRLS International Study Center incorporated the QIRC suggestions into the questionnaires |
| August | 2018 | NRCs reviewed the proposed TIMSS 2019 Home, School, Teacher, and Student Questionnaires ( $5^{\text {th }}$ NRC meeting-Stockholm, Sweden) |
| August | 2018 | TIMSS \& PIRLS International Study Center distributed the TIMSS 2019 Home, School, Teacher, and Student Questionnaires to NRCs for translation and verification |
| OctoberDecember | 2018 | Southern Hemisphere countries conducted TIMSS 2019 Data Collection |
| January-March | 2019 | TIMSS \& PIRLS International Study Center incorporated the QIRC suggestions into the TIMSS 2019 Curriculum Questionnaire and Encyclopedia chapter outline |
| March | 2019 | NRCs reviewed the proposed TIMSS 2019 Curriculum Questionnaire and Encyclopedia chapter outline ( $6{ }^{\text {th }}$ NRC meeting-Limassol, Cyprus) |
| March-June | 2019 | Northern Hemisphere countries conducted TIMSS 2019 Data Collection |
| April-October | 2019 | NRCs responded to the online TIMSS 2019 Curriculum Questionnaire |
| OctoberFebruary | 2019 | NRCs submitted their TIMSS 2019 Encyclopedia chapters to the TIMSS \& PIRLS International Study Center |

## CHAPTER 3

## Sample Design in TIMSS 2019

Sylvie LaRoche Marc Joncas

Pierre Foy

## Introduction

TIMSS is designed to provide valid and reliable measurement of trends in student achievement in countries around the world, while keeping to a minimum the burden on schools, teachers, and students. The TIMSS program employs rigorous school and classroom sampling techniques so that achievement in the student population as a whole may be estimated accurately by assessing just a sample of students from a sample of schools. TIMSS assesses mathematics and science achievement at two grade levels and so TIMSS has two target populations-all students enrolled at the fourth grade and all students enrolled at the eighth grade, counting from the first year of primary schooling. Countries may assess either one or both student populations. In addition, at the fourth grade for the TIMSS 2019 cycle, countries for which the regular fourth grade mathematics assessment is too difficult have the option to administer a less difficult mathematics assessment, consisting of one third of the items from the regular assessment and two-thirds less difficult items. Countries availing of the less difficult mathematics option administer the regular fourth grade science assessment.

TIMSS 2019 marks the beginning of the TIMSS transition to computer based assessment, with countries having the option of administering the new computer-based version of the 2019 assessment, known as eTIMSS, or the paper-and-pencil version as in previous assessment cycles (paperTIMSS). Although the two versions were developed to be as similar in content as possible, inevitably there are some differences between them as a result of the two modes of administration. In order to control for mode effects while linking the two versions to the TIMSS achievement scales and to safeguard the measurement of trends from previous assessments, eTIMSS countries also provide a separate sample of "bridge" data. The bridge data result from administering the paper version of the trend items (eight blocks of items for each subject and grade that also were administered in 2015) to a separate, equivalent sample of students during the main data collection. These paper versions of the trend items are identical in most respects
to the eTIMSS versions that are administered as part of the main eTIMSS assessment, and so comparing performance on the eTIMSS versions to performance on the paper versions administered to the bridge sample provides a bridge between the two assessment modes.

The TIMSS assessments employ a two-stage random sample design, with a sample of schools drawn as a first stage and one or more intact classes of students selected from each of the sampled schools as a second stage. Intact classes of students are sampled rather than individuals from across the grade level or of a certain age because TIMSS pays particular attention to students' curricular and instructional experiences, and these typically are organized on a classroom basis. Sampling intact classes also has the operational advantage of less disruption to the school's day-to-day business than individual student sampling.

## National Sampling Plan

Each country participating in TIMSS needs a plan for defining its national target population and applying the TIMSS sampling methods to achieve a nationally representative sample of schools and students. The development and implementation of the national sampling plan is a collaborative exercise involving the country's National Research Coordinator (NRC) and TIMSS sampling experts.

Statistics Canada is responsible for advising the National Research Coordinator on all sampling matters and for ensuring that the national sampling plan conforms to the TIMSS standards. In cooperation with sampling staff from IEA Hamburg, Statistics Canada works with the NRC to select the national school sample(s) and produce all supporting documentation for tracking the sampled schools. This includes ensuring that the school sampling frame (the school population list from which the school sample is drawn) provided by the NRC is complete and satisfactory; checking that categories of excluded students are clearly defined, justified, and kept to a minimum; assisting the NRC in determining the sample size and a stratification plan that will meet both international and national objectives; and drawing a national sample of schools. When sampling has been completed and all data collected, Statistics Canada documents population coverage and school and student participation rates and constructs appropriate sampling weights for use in analyzing and reporting the results.

The TIMSS \& PIRLS International Study Center, in cooperation with Statistics Canada and IEA Hamburg, provides National Research Coordinators with a series of manuals to guide them through the sampling process. More specifically, TIMSS 2019 Survey Operations Procedures Unit 1: Sampling Schools and Obtaining their Cooperation describes the steps involved in defining the national target population and selecting the school sample, and TIMSS 2019 Survey Operations Procedures Unit 3: Contacting Schools and Sampling Classes for the TIMSS 2019 Data Collection describes the procedure for sampling classes within the sampled schools and making preparations for conducting the assessments. Within-school sampling procedures for the field test are documented in TIMSS 2019 Survey Operations Procedures Unit 2: Preparing for and Conducting the TIMSS 2019 Field Test. More information on the Survey Operations Units can be found in Chapter 6 of this volume.

The TIMSS National Research Coordinator is responsible for providing Statistics Canada with all information and documentation necessary to conduct the national sampling, and for conducting all sampling operations in the country. In particular, the NRC is expected to identify the grade(s) that correspond to the international target population(s); create a sampling frame by listing all schools in the population that have classes with students in the target grade(s); determine national population coverage and exclusions, in accordance with the TIMSS international guidelines; work with Statistics Canada to develop a national sampling plan and identify suitable stratification variables, ensuring that these variables are present and correct for all schools; contact all sampled schools and secure their participation; keep track of school participation and the use of replacement schools; and conduct all within-school sampling of classes. As described in this chapter, each NRC is required to complete a series of sampling forms documenting the completion of each of these tasks.

A crucial feature of each international meeting of National Research Coordinators is a one-to-one meeting between each NRC and sampling staff at Statistics Canada and IEA Hamburg. At these meetings, each step of the sampling process is documented and reviewed in detail, and NRCs have the opportunity to raise issues and ask questions about their national situation and any challenges they face. Statistics Canada consults with the TIMSS \& PIRLS International Study Center and the International Sampling Referee, as necessary, to resolve issues and questions. Final approval of TIMSS national sampling plans is the responsibility of the TIMSS \& PIRLS International Study Center, based upon the advice of Statistics Canada and the International Sampling Referee.

## Defining the Target Population

As an international study of the comparative effects of education on student achievement in mathematics and science, TIMSS defines its international target populations in terms of the amount of schooling students have received. The number of years of formal schooling is the basis of comparison among participating countries. Thus, the TIMSS international target population at the fourth grade is all students in their fourth year of formal schooling, and at the eighth grade, all students in their eighth year. UNESCO's International Standard Classification of Education (ISCED) 2011 (UNESCO, 2012) provides an internationally accepted classification scheme for describing levels of schooling across countries. The ISCED system describes the full range of schooling, from preprimary (Level 0) to the doctoral level (Level 8). ISCED Level 1 corresponds to primary education or the first stage of basic education. The first year of Level 1 "coincides with the transition point in an education system where systematic teaching and learning in reading, writing and mathematics begins" (UNESCO, 2012, p. 30). Four years after this would be the target grade for fourth grade TIMSS and is the fourth grade in most countries. Similarly, eight years after the first year of ISCED Level 1 is the target grade for eighth grade TIMSS and is the eighth grade in most countries. However, given the cognitive demands of the assessments, TIMSS wants to avoid assessing
very young students. Thus, TIMSS recommends assessing the next higher grade (i.e., fifth grade for fourth grade TIMSS and ninth grade for eighth grade TIMSS) if, for fourth grade students, the average age at the time of testing would be less than 9.5 years and, for eighth grade students, less than 13.5 years.

The fourth grade and eighth grade target populations of students are defined as follows:

- Fourth grade: All students enrolled in the grade that represents four years of schooling counting from the first year of ISCED Level 1, providing the mean age at the time of testing is at least 9.5 years
- Eighth grade: All students enrolled in the grade that represents eight years of schooling counting from the first year of ISCED Level 1, providing the mean age at the time of testing is at least 13.5 years

All students enrolled in the target grade, regardless of their age, belong to the international target population and should be eligible to participate in TIMSS. Because students are sampled in two stages, first by randomly selecting a school and then randomly selecting a class from within the school, it is necessary to identify all schools in which eligible students are enrolled. Essentially, eligible schools for TIMSS are those that have any students enrolled in the target grade, regardless of type of school. All schools of all educational sub-systems that have students learning full time in the target grade are part of the international target population, including schools that are not under the authority of the national Ministry of Education.

## National Target Populations

For most countries, the target grade for TIMSS is the fourth and/or eighth grade. However, because educational systems vary in structure and in policies and practices with regard to age of starting school and promotion and retention, there are differences across countries in how the target grades are labelled and in the average age of students. To ensure that the appropriate national target grades are selected, each NRC completes Sampling Form 1, which identifies the target grades, the country's name for those grades, and the average age of students in those grades at the time of data collection. An example of a completed Sampling Form 1 is presented in Exhibit 3.1.

For a variety of reasons, there are countries where students in the fifth or sixth grade are more likely to have developed the mathematics and science competencies necessary for success on the TIMSS fourth grade assessment, or in the ninth grade for the TIMSS eighth grade assessment. Such countries may choose to participate in TIMSS at either the fifth or sixth grade or in the less difficult mathematics fourth grade assessment. Similarly, some countries may choose to administer the TIMSS eighth grade assessment to their ninth grade students.

Exhibit 3.1: Example of Sampling Form 1

## Sampling Form 1

## General Information

See Section 2 of TIMSS 2019 Survey Operations Procedures Unit 1

| TIMSS 2019 Participant : | Country $X$ |
| :--- | :--- |
| National Research Coordinator: | Name of NRC |

1. Please indicate the assessment(s) in which your country plans to participate along with the target grade(s), name(s), and expected average age of students at the time of testing:

2. Specify the usual start and end date(s) of the school year and the expected date(s) of testing for the field test and data collection.

|  | Start of school year: <br> (DD-MM-YYYY) | End of school year: <br> (DD-MM-YYYY) | Expected Testing <br> Period |
| :--- | :---: | :---: | :---: |
| Field Test | $05 / 09 / 2017$ | $22 / 06 / 2018$ | $16-27$ April 2018 |
| Data Collection | $01 / 09 / 2018$ | $21 / 06 / 2019$ | $13-24$ April 2019 |

4. Specify the language(s) in which the assessment(s) will be administered.

English
5. Describe the grade structure through ISCED Level 1 (primary education or the first stage of basic education) and ISCED Level 2 (basic or lower secondary education) in your country.
Grades 1 to 6, Primary schools
Grades 7 to 9, Lower secondary schools
6. Describe the age and birth date rules for entering ISCED Level 1 in your country.

Children must enter school (grade 1) in the autumn of the year in which they have their sixth birthday

## National Coverage and Exclusions

TIMSS is designed to describe and summarize student achievement across the entire target grade (fourth or eighth), and so it is very important that national target populations aim for comprehensive coverage of eligible students. However, in some cases, political, organizational, or operational factors make complete national coverage difficult to attain. Thus, in some rare situations, certain groups of schools and students may have to be excluded from the national target population. For example, it may be that a particular geographical region, educational sub-system, or language group cannot be covered. Such exclusion of schools and students from the target population is referred to as reduced population coverage.

Even countries with complete population coverage find it necessary to exclude at least some students from the target population because they attend very small schools, have intellectual or functional disabilities, or are non-native language speakers. Such students may be excluded at the school level (i.e., the whole school is excluded) or within the school on an individual basis.

School-Level Exclusions. Although it is expected that very few schools will be excluded from the national target population, NRCs are permitted to exclude schools on the following grounds when they consider it necessary:

- Inaccessibility due to their geographically remote location
- Extremely small size (e.g., four or fewer students in the target grade)
- Offering a grade structure, or curriculum, radically different from the mainstream educational system
- Providing instruction solely to students in the student-level exclusion categories listed below (e.g., catering only to special needs students)

Student-Level Exclusions. The international within-school exclusion rules are specified as follows:

- Students with functional disabilities - These are students who have physical disabilities such that they cannot perform in the TIMSS testing situation. Students with functional disabilities who are able to perform should be included in the testing.
- Students with intellectual disabilities - These are students who are considered, in the professional opinion of the school principal or by other qualified staff members, to have intellectual disabilities or who have been tested as such. This includes students who are emotionally or mentally unable to follow even the general instructions of the test. Students should not be excluded solely because of poor academic performance or normal disciplinary problems. It should be noted that students with dyslexia, or other such learning disabilities, should be accommodated in the test situation if possible, rather than excluded.
- Non-native language speakers - These are students who are unable to read or speak the language(s) of the test and would be unable to overcome the language barrier in the test situation. Typically, a student who has received less than one year of instruction in the language(s) of the test should be excluded.

Because disability criteria vary from country to country, NRCs are asked to translate the TIMSS international exclusion standards into the local equivalent. Students should be considered for exclusion strictly in accordance with the international standards. If a sampled school contains a class consisting entirely of students from one of the exclusion categories, such a class is excluded prior to classroom sampling.

NRCs understand that exclusion rates must be kept to a minimum so that national samples accurately represent the national target population. Requirements for exclusion rates include the following:

- The overall number of excluded students must not account for more than 5 percent of the national target population of students in a country. The overall number includes both school-level and within-school exclusions.
- The number of students excluded because they attend very small schools must not account for more than 2 percent of the national target population of students.

To document population coverage and exclusions, each NRC completes Sampling Form 2, which lists the number of students in the national target population and the number of students excluded at both the school level and within the school for each population to be assessed. An example of a completed Sampling Form 2 is presented in Exhibit 3.2.

Exhibit 3.2: Example of Sampling Form 2

## Requirements for Sampling the Target Population

TIMSS sets high standards for sampling precision, participation rates, and sample implementation in order to achieve national samples of the highest quality and survey estimates that are unbiased, accurate and internationally comparable.

## Sampling Precision and Sample Size

Because TIMSS is fundamentally a study of student achievement, the precision of estimates of student achievement is of primary importance. To meet the TIMSS standards for sampling precision, national student samples should provide for a standard error no greater than .035 standard deviation units for the country's mean achievement. This standard error corresponds to a $95 \%$ confidence interval of $\pm 7$ score points for the achievement mean and of $\pm 10$ score points for the difference between achievement means from successive cycles (e.g., the difference between a country's achievement mean on TIMSS 2015 and TIMSS 2019). ${ }^{1}$ Sample estimates of any student-level percentage estimate (e.g., a student background characteristic) should have a confidence interval of $\pm 3.5 \%$.

For most countries, the TIMSS precision requirements are met with a school sample of 150 schools and a student sample of 4,000 students for each target grade. Depending on the average class size in the country, one class from each sampled school may be sufficient to achieve the desired student sample size. For example, if the average class size in a country were 27 students, a single class from each of 150 schools would provide a sample of 4,050 students (assuming full participation by schools and students). Some countries choose to sample more than one class per school, either to increase the size of the student sample or to provide a better estimate of school-level effects.

Countries transitioning to eTIMSS require an additional sample of at least 1,500 tested students for the bridge data collection. This bridge sample is obtained by selecting one additional class from a subset of the sampled schools, by selecting a distinct sample of schools, or by a combination of both strategies. The most suitable approach is developed with the sampling experts from Statistics Canada during the sampling development stage.

A school sample larger than the minimum of 150 schools may be required under the following circumstances:

- The average class size in a country is so small that, even when sampling more than one classroom per school, it is not possible to reach the student sample size requirements by selecting only 150 schools.
- Previous cycles of TIMSS showed that the sampling precision requirements cannot be met unless a larger school sample is selected.

[^0]- Classes within schools are tracked by student performance (more common at eighth grade than at fourth grade). This increases variation between classes in student achievement and can reduce sampling precision. In this situation, it is advisable to sample at least two classrooms per school whenever possible, in addition to sampling more schools.
- A high level of non-response is anticipated, leading to sample attrition and reduced sample size. Note that while a larger school sample helps to maintain sample size in the face of non-response, it does not compensate for non-response bias.

## Field Test Sample

Although the TIMSS field test is scheduled in the school year before the year of data collection, the school sample for the field test is drawn at the same time and from the same population of schools as the full sample. The field test sample size requirement is 200 students per field test achievement booklet, and so the total field test sample size is a function of the number of achievement booklets being field tested. For TIMSS 2019, the paperTIMSS field test has five booklets per target grade and so requires a field test sample of 1,000 students at each grade. The eTIMSS field test has five item block combinations (corresponding to the five paperTIMSS booklets) requiring 1,000 students at each grade, and also three block combinations of Problem Solving and Inquiry tasks (PSIs). Each PSI block appears in two different item block combinations, so the three block combinations require a further 300 students, for a total field test sample of 1,300 students.

## Participation Rates

To minimize the potential for non-response bias, TIMSS aims for 100 percent participation by sampled schools, classrooms, and students, while recognizing that some degree of non-participation may be unavoidable. For a national sample to be fully acceptable it must have either:

- A minimum school participation rate of 85 percent, based on originally sampled schools AND
- A minimum classroom participation rate of 95 percent, from originally sampled schools and replacement schools AND
- A minimum student participation rate of 85 percent, from sampled schools and replacement schools

OR

- A minimum combined school, classroom, and student participation rate of 75 percent, based on originally sampled schools (although classroom and student participation rates may include replacement schools)

Classrooms with less than 50 percent student participation are deemed to be not participating.

## Developing and Implementing the National Sampling Plan

Although National Research Coordinators are responsible for developing and implementing national sampling plans, Statistics Canada and the IEA Sampling team work closely with NRCs to help ensure that these sampling plans fully meet the standards set by the TIMSS \& PIRLS International Study Center, while also adapting to national circumstances and requirements. National sampling plans must be based on the international two-stage sample design (schools as the first stage and classes within schools as the second stage) and must be approved by Statistics Canada.

## TIMSS Stratified Two-Stage Cluster Sample Design

The basic international sample design for TIMSS is a stratified two-stage cluster sample design, as follows:
First Sampling Stage. For the first sampling stage, schools are sampled with probability proportional to their size (PPS) from the list of all schools in the population that contain eligible students. The schools in this list (or sampling frame) may be stratified (sorted) according to important demographic variables. Schools for the field test and data collection are sampled simultaneously using a systematic random sampling approach. Two replacement schools are also pre-assigned to each sampled school during the sample selection process, and these replacement schools are held in reserve in case the originally sampled school refuses to participate. Replacement schools are used solely to compensate for sample size losses in the event that the originally sampled school does not participate. School sampling is conducted for each country by Statistics Canada with assistance from the IEA Sampling Team, using the sampling frame provided by the country's National Research Coordinator.

Second Sampling Stage. The second sampling stage consists of selecting one (or more) intact class from the target grade of each participating school. Class sampling in each country is conducted by the National Research Coordinator using the Within-School Sampling Software (WinW3S) developed by IEA Hamburg and Statistics Canada. Having secured a sampled school's agreement to participate in the assessment, the NRC requests information about the number of classes and teachers in the school and enters it in the WinW3S database. Classes smaller than a specified minimum size are combined into pseudo-classes prior to sampling. The software samples one or more classes with equal probability in each school. All students in each sampled class participate in the assessment. Sampled classes that refuse to participate may not be replaced.

An additional sampling step is required for eTIMSS countries that require a bridge sample. Students in the bridge sample are administered a paper version of the trend item blocks, and it is important that this sample should mirror the main eTIMSS sample as closely as possible. For operational reasons it is not possible to administer both the eTIMSS assessment and bridge assessment in the same class, so the bridge sample should consist of an extra class from a school sampled for eTIMSS or from an additional school. In schools selected for both the eTIMSS and the bridge samples, separate classes are sampled and randomly assigned to either the eTIMSS or bridge samples using the WinW3S software.

## Stratification

Stratification consists of arranging the schools in the target population into groups, or strata, that share common characteristics such as geographic region or school type. Examples of stratification variables used in TIMSS include region of the country (e.g., states or provinces); school type or source of funding (e.g., public or private); language of instruction; level of urbanization (e.g., urban or rural area); socioeconomic indicators; and school performance on national examinations.

In TIMSS, stratification is used to:

- Improve the efficiency of the sample design, thereby making survey estimates more reliable
- Apply different sample designs, such as disproportionate sample allocations, to specific groups of schools (e.g., those in certain states or provinces)
- Ensure proportional representation of specific groups of schools in the sample

School stratification can take two forms: explicit and implicit. In explicit stratification, a separate school list or sampling frame is constructed for each stratum and a sample of schools is drawn from that stratum. In TIMSS, the major reason for considering explicit stratification is disproportionate allocation of the school sample across strata. For example, in order to produce equally reliable estimates for each geographic region in a country, explicit stratification by region may be used to ensure the same number of schools in the sample for each region, regardless of the relative population size of the regions.

Implicit stratification consists of sorting the schools by one or more stratification variables within each explicit stratum, or within the entire sampling frame if explicit stratification is not used. The combined use of implicit strata and systematic sampling is a simple and effective way of ensuring a proportional sample allocation of students across all implicit strata. Implicit stratification also can lead to improved reliability of achievement estimates when the implicit stratification variables are correlated with student achievement.

National Research Coordinators consult with Statistics Canada and the IEA Sampling team to identify the stratification variables to be included in their sampling plans. The school sampling frame is sorted by the stratification variables prior to sampling schools so that adjacent schools are as similar as possible. Regardless of any other explicit or implicit variables that may be used, the school size is always included as an implicit stratification variable.

To document the stratification variables used in their sampling plans, each NRC completes Sampling Form 3, which lists the variables to be used for explicit and implicit stratification, and the number of levels of each stratification variable. An example of a completed Sampling Form 3 is presented in Exhibit 3.3. Further details on the explicit and implicit stratification variables for each country can be found in the Characteristics of National Samples section in Chapter 9: Sampling Implementation.

3. If applicable, describe any additional requirements for sub-national estimates, either for reporting or analysis purposes (e.g., oversampling of specific groups of the population):
would like to have reliable estimates for students from the private schools

## School Sampling Frame

One of the National Research Coordinator's most important sampling tasks is the construction of a school sampling frame for the target population. The sampling frame is a list of all schools in the country that have students enrolled in the target grade, and is the list from which the school sample is drawn. A wellconstructed sampling frame provides complete coverage of the national target population without being contaminated by incorrect or duplicate entries or entries that refer to elements that are not part of the defined target population.

A suitable school measure of size (MOS) is a critical aspect of the national sampling plan, because the size of a school determines its probability of selection. The most appropriate school measure of size is an up-to-date count of the number of students in the target grade. If the number of students in the target grade is not available, total student enrollment in the school may be the best available substitute.

Sampling Form 4, presented in Exhibit 3.4, provides some basic information about the school sampling frame, including the average class size at the target grade, the number of classrooms to be sampled per school, the school measure of size (MOS) to be used for school sampling, and the school year from which the frame was constructed.

Name of the MOS variable
in the school frame:
GR4_STD

If "Other," please describe:
3. Specify the average class size (ACS) for the target grade in your schools.
4. Specify how many classrooms you plan to sample per school. (Click in box and on right arrow to see drop down menu)
2. More than one classroom in tracked schools

If "Other," please describe:

5. Specify the school year for which enrollment data will be used for the school MOS.
6. If a frame other than a single-level sampling frame (list of all schools) is to be used, please provide a preliminary description of the information available to construct this frame.

## Not applicable

The school sampling frame is usually a spreadsheet containing a single entry for each school. This entry includes a unique identification number and contact information (if appropriate given the country's privacy laws), the values of the stratification variables for the school, and the school measure of size. It is useful if the school entry also includes the number of classes in the school in the target grade because this provides a mechanism for predicting in advance the size of the eventual student sample. This predicted sample size may be compared with the eventual student sample size as a check on the sampling process.

Exhibit 3.5 provides an example of a partial sampling frame for a country conducting TIMSS 2019 at the eighth grade. In this example, region and urbanization are used as stratification variables.

## Sampling Schools

Once the school sampling frame is structured to meet all international and national requirements, Statistics Canada can draw the school sample. If the sampling frame is explicitly stratified, it is necessary to decide how the school sample is to be allocated among the explicit strata (i.e., the number of schools to be sampled in each stratum). When this has been decided, a sample of schools is selected within each explicit stratum using systematic sampling with probabilities proportional to size (PPS). The PPS technique means that the larger schools, those with more students, have a higher probability of being sampled than the smaller schools. However, this difference in the selection probabilities of larger and smaller schools is largely offset at the second stage of sampling by selecting a fixed number of classes
(usually one or two) with equal probability from the sampled school. Classes in large schools with many classes at the target grade have a lower probability of selection than classes in smaller schools that have just one or two classes. A description of the school sampling procedure is provided in Appendix 3A.

Even though the field test is scheduled in the school year before the year of data collection in most countries, the preferred approach in TIMSS is to select both samples of schools at the same time. This ensures that both the field test and data collection samples constitute random samples representative of all schools in the country, and that no school is selected for both samples. ${ }^{2}$

Replacement Schools. Ideally, all schools sampled for TIMSS should participate in the assessments, and NRCs work hard to achieve this goal. Nevertheless, it is anticipated that a 100 percent participation rate may not be possible in all countries. To avoid sample size losses, the sampling plan identifies, $a$ priori, specific replacement schools for each sampled school. Each originally sampled school has two preassigned replacement schools, usually the school immediately preceding the originally sampled school on the school sampling frame and the one immediately following it. Replacement schools always belong to the same explicit stratum as the original but may come from different implicit strata if the school they are replacing is either the first or last school of an implicit stratum.

The main justification for replacement schools in TIMSS is to ensure adequate sample sizes for analysis of subpopulation differences. Although the use of replacement schools does not eliminate the risk of bias due to school nonparticipation, employing implicit stratification and ordering the school sampling frame by school size increases the chances that a sampled school's replacements would have similar characteristics. This approach maintains the desired sample size while restricting replacement schools to strata where nonresponse occurs. Since the school frame is ordered by school size, replacement schools also tend to be similar in size to the school they are designated to replace.

NRCs understand that they should make every effort to secure the participation of all of the sampled schools. Only after all attempts to persuade a sampled school to participate have failed is the use of its replacement school considered.

## Common Adjustments to the TIMSS School Sampling Design

The TIMSS school sample design offers considerable flexibility to countries participating at both fourth and eighth grades to maximize or minimize the extent to which the same schools are assessed. Where fourth and eighth grade students attend the same school, some countries find it more efficient to administer TIMSS at the same school for both grades. In other cases, countries try to ensure that assessments are spread across schools and therefore prefer that TIMSS at the fourth and eighth grades are not administered at the same school and/or that TIMSS sampling avoid, when possible, selecting schools that have recently administered other national and international assessments. To provide flexibility to

2 With approval from the TIMSS \& PIRLS international Study Center, the field test and full sample could be selected separately. In such cases an overlap control procedure is used to minimize the probability of selecting schools for the data collection that already had been sampled for the field test. This was the case for most eTIMSS countries due to operational constraints.
meet these requests, Statistics Canada implements modified sampling procedures-the details of which are described in Appendix 3B.

## Sampling Classes

Within each sampled school, all classes with students at the target grade are listed, and one or more intact classes are selected with equal probability of selection using systematic random sampling. This procedure is implemented using the WinW3S sampling software. The selection of classes with equal probability, combined with the PPS sampling method for schools, in general results in a self-weighting student sample. If the school has multi-grade classes (i.e., the class contains students from more than one grade level), only students from the target grade are eligible for sampling.

When a country participating in eTIMSS has schools selected for both the eTIMSS and the bridging assessments, sampled classes within these schools are randomly assigned to one study or the other. This is done automatically within the WinW3S software.

Because small classes tend to increase the risk of unreliable survey estimates and can lead to reduced overall student sample size, it is necessary to avoid sampling too many small classes. Based on consideration of the size distribution of classes and the average class size, a lower class size limit or minimum class size (MCS) is specified for each country. Prior to sampling classes in a school, any class smaller than the MCS is combined with another class in the school to form a pseudo-class for sampling purposes. The procedure for sampling classes within schools is described in more detail in the Survey Operations Procedures chapter of this volume.

## Sampling Weights

National student samples in TIMSS are designed to accurately represent the target populations within a specified margin of sampling error, as described previously. After the data have been collected and processed, sample statistics such as means and percentages that describe student characteristics are computed as weighted estimates of the corresponding population parameters, where the weighting factor is the sampling weight. A student's sampling weight is essentially the inverse of the student's probability of selection, with appropriate adjustments for nonresponse. In principle, the stratified two-stage sampling procedure used in TIMSS, where schools are sampled with probability proportional to school size and classes are sampled with probability inversely proportional to school size, provides student samples with equal selection probabilities. However, in practice, disproportionate sampling across explicit strata by varying the number of classes selected and differential patterns of nonresponse can result in varying selection probabilities, requiring a unique sampling weight for the students in each participating class in the study.

The student sampling weight in TIMSS is a combination of weighting components reflecting selection probabilities and sampling outcomes at three levels-school, class, and student. At each level, the weighting component consists of a basic weight that is the inverse of the probability of selection at that level, together with an adjustment for nonparticipation. The overall sampling weight for each student is the product of the three weighting components: school, class (within school), and student (within class).

Usually in TIMSS a country has only one set of sampling weights per target population (fourth and/ or eighth grade). However, because of the introduction of the Problem Solving and Inquiry (PSI) tasks into the eTIMSS 2019 booklet rotation, eTIMSS countries have one set of sampling weights only for students who were assigned regular eTIMSS booklets, and a second set for all students, including those assigned PSI booklets. The first set of weights is computed in the same way for both eTIMSS and paperTIMSS countries (since the paperTIMSS countries do not use the PSI booklets) and is used for most analytic and reporting purposes in TIMSS 2019. Where necessary, these are referred to as the "TIMSS weights" to distinguish them from the second set, or "TIMSS+PSI weights."

In addition to the weights described above, countries with bridge data have a further set of weights exclusively for the bridge sample. Further details on the special weight adjustments for eTIMSS and the bridge data may be found in Chapter 9: Sampling Implementation. Regardless of whether they pertain to the regular booklet sample, the regular and PSI booklet sample, or the bridge sample, the procedure for calculating weights and nonparticipation adjustments remains the same.

## School Weighting Component

Given that schools in TIMSS are sampled with probability proportional to school size, the basic school weight for the $i^{\text {th }}$ sampled school (i.e., the inverse of the probability of the $i^{\text {th }}$ school being sampled) is defined as:

$$
\begin{equation*}
B W_{s c}^{i}=\frac{M}{n \cdot m_{i}} \tag{3.1}
\end{equation*}
$$

where $n$ is the number of sampled schools, $m_{i}$ is the measure of size for the $i^{\text {th }}$ school, and

$$
\begin{equation*}
M=\sum_{i=1}^{N} m_{i} \tag{3.2}
\end{equation*}
$$

where $N$ is the total number of schools in the explicit stratum. ${ }^{3,4}$
School Nonparticipation Adjustment. If a sampled school does not participate in TIMSS and its two designated replacement schools do not participate, it is necessary to adjust the basic school weight to

3 For countries such as the Russian Federation that include a preliminary sampling stage, the basic school weight also incorporates the probability of selection in this preliminary stage. The basic school weight in such cases is the product of the preliminary stage weight and the school weight.
4 In schools selected for both the eTIMSS and the bridge samples, sampled classes are randomly assigned to either the eTIMSS or the bridge samples using the WinW3S software. If such a school has only one class, WinW3S randomly assigns the class to one of the samples (eTIMSS or bridge). In such cases, an adjustment is applied to the school weight in the corresponding explicit stratum of the non-selected sample.
compensate for the reduction in sample size. The school-level nonparticipation adjustment is calculated separately for each explicit stratum, as follows:

$$
\begin{equation*}
A_{s c}=\frac{n_{s}+n_{r 1}+n_{r 2}+n_{n r}}{n_{s}+n_{r 1}+n_{r 2}} \tag{3.3}
\end{equation*}
$$

where $n_{s}$ is the number of originally sampled schools that participated, $n_{r 1}$ and $n_{r 2}$ the number of first and second replacement schools, respectively, that participated, and $n_{n r}$ is the number of schools that did not participate. Sampled schools that are found to be ineligible ${ }^{5}$ are not included in the calculation of this adjustment.

Combining the basic school weight and the school nonparticipation adjustment, the final school weighting component for the $i^{\text {th }}$ school becomes:

$$
\begin{equation*}
F W_{s c}^{i}=A_{s c} \cdot B W_{s c}^{i} \tag{3.4}
\end{equation*}
$$

It should be noted that, as well as being a crucial component of the overall student weight, the final school weighting component is a sampling weight in its own right, and can be used in analyses where the school is the unit of analysis.

## Class Weighting Component

The class weighting component reflects the class-within-school selection probability. After a school has been sampled and has agreed to participate in TIMSS, one or more classes are sampled with equal probability from the list of all classes in the school at the target grade. Because larger schools have more classes from which to sample than smaller schools, the probability of class selection varies with school size, with students in small schools more likely to have their class selected than students in large schools. This relatively greater selection probability for students in small schools offsets their lower selection probability at the first stage, where probability-proportional-to-size school sampling results in higher selection probabilities for larger schools.

The basic class-within-school weight for a sampled class is the inverse of the probability of the class being selected from all of the classes in its school. For the $i^{\text {th }}$ sampled school, let $C^{i}$ be the total number of eligible classes and $c^{i}$ the number of sampled classes. Using equal probability sampling, the basic class weight for all sampled classes in the $i^{\text {th }}$ school is:

$$
\begin{equation*}
B W_{c l}^{i}=\frac{C^{i}}{c^{i}} \tag{3.5}
\end{equation*}
$$

For most TIMSS participants, $c^{i}$ takes the values 1 or 2.

Class Nonparticipation Adjustment. Basic class weights are calculated for all sampled classes in the sampled and replacement schools that participate in TIMSS. A class-level nonparticipation adjustment is applied to compensate for classes that do not participate or where the student participation rate is below 50 percent. ${ }^{6}$ Such sampled classes are assigned a weight of zero. Class nonparticipation adjustments are applied at the explicit stratum level rather than at the school level to minimize the risk of bias. The adjustment is calculated as follows:

$$
\begin{equation*}
A_{c l}=\frac{\sum_{i}^{s+r 1+r^{2}} 1}{\sum_{i}^{s+r 1+r 2} \delta_{i} / c^{i}} \tag{3.6}
\end{equation*}
$$

where $c^{i}$ is the number of sampled classes in the $i^{\text {th }}$ school, as defined earlier, and $\delta_{i}$ gives the number of participating classes in the $i^{\text {th }}$ school.

Combining the basic class weight and the class nonparticipation adjustment, the final class weighting component, assigned to all sampled classes in the $i^{\text {th }}$ school, becomes:

$$
\begin{equation*}
F W_{c l}^{i, j}=A_{c l} \cdot B W_{c l}^{i} \tag{3.7}
\end{equation*}
$$

## Student Weighting Component

The student weighting component represents the student-within-class selection probability. The basic student weight is the inverse of the probability of a student in a sampled class being selected.

In the typical TIMSS situation where intact classes are sampled, all students in the class are included, and so this probability is unity. However, under certain circumstances, students may be sampled within the class, and in this situation the probability is less than unity.

It should be noted that within-class student sampling is in effect when calculating the weights for the regular eTIMSS booklets for eTIMSS countries (the "TIMSS weight"). In this situation, students who were assigned a regular eTIMSS booklet are considered as being selected while students who received a PSI booklet are considered as not selected.

For an intact class with no student subsampling, the basic student weight for the $j^{\text {th }}$ class in the $i^{\text {th }}$ school is computed as follows:

$$
\begin{equation*}
B W_{s t 1}^{i, j}=1.0 \tag{3.8}
\end{equation*}
$$

For classes with student subsampling, the basic student weight for the $j^{\text {th }}$ class in the $i^{\text {th }}$ school is:

$$
\begin{equation*}
B W_{s t 2}^{i, j}=\frac{n_{r g}^{i, j}+n_{b s}^{i, j}}{n_{r g}^{i, j}} \tag{3.9}
\end{equation*}
$$

Where $n_{r g}^{i, j}$ is the number of students in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school selected to participate in TIMSS and $n_{b s}^{i, j}$ is the number of students in the class not selected.

Calculating the eTIMSS weights for the regular booklet sample (the "TIMSS weight") involves student subsampling as described above, but with the added complication that the participation status is known for all the students in each sampled class. In this case, the basic student weight for the $j^{\text {th }}$ class in the $i^{\text {th }}$ school for this set of weights is given by:

$$
B W_{s t 3}^{i, j}=\left\{\begin{array}{c}
1 \quad \text { for students who left school or were excluded, }  \tag{3.10}\\
\frac{n_{r g^{\prime}}^{i, j}+n_{b s^{\prime}}^{i, j}}{n_{r g^{\prime}}^{i, j}}
\end{array}\right. \text { for all other students who received a regular eTIMSS booklet }
$$

where, $n_{r g^{\prime}}^{i, j}$ and $n_{b s^{\prime}}^{i, j}$ represent the number of students in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school who received a regular eTIMSS booklet and the number of students in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school who received a PSI booklet respectively, without counting students who either were excluded or left school after the class listing was completed.

Adjustment for Non-Participation. The student nonparticipation adjustment for the $j^{\text {th }}$ classroom in the $i^{\text {th }}$ school is calculated as:

$$
\begin{equation*}
A_{s t 1}^{i, j}=A_{s t 2}^{i, j}=A_{s t 3}^{i, j}=\frac{s_{r s}^{i, j}+s_{n r}^{i, j}}{s_{r s}^{i, j}} \tag{3.11}
\end{equation*}
$$

where $s_{r s}^{i, j}$ is the number of participating students in the $j^{\text {th }}$ class of the $i^{\text {th }}$ school and $s_{n r}^{i, j}$ is the number of students sampled in this class who were expected to have assessment scores but did not participate in the assessment. For intact classes, the sum of $s_{r s}^{i, j}$ and $s_{n r}^{i, j}$ is the total number of students listed in the class, not counting excluded students or students who have left the school since class list was published. When calculating the "TIMSS weight" for eTIMSS countries (without the PSI booklets), the sum of $s_{r s}^{i, j}$ and $s_{n r}^{i, j}$ is the total number of students who received a regular eTIMSS booklet in the class, not counting excluded students or students who have left the school since class list was published

The final student weighting component for students in the $j^{\text {th }}$ classroom of the $i^{\text {th }}$ school is:

$$
\begin{equation*}
F W_{s t}^{i, j}=A_{s t \Delta}^{i, j} \cdot B W_{s t \Delta}^{i, j} \tag{3.12}
\end{equation*}
$$

where $\Delta$ equals 1 when there was no student subsampling (intact classes), 2 when a sample of students was drawn from the students in the class, and 3 when calculating the set of eTIMSS weights for only regular eTIMSS booklets.

Overall Student Sampling Weight. The overall student sampling weight is the product of the final weighting components for schools, classes, and students, as follows:

$$
\begin{equation*}
W^{i, j}=F W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j} \tag{3.13}
\end{equation*}
$$

Overall student sampling weights are only attributed to participating students, with non-participants weighted at 0 . All student data reported in the TIMSS international reports are weighted by the overall student sampling weight, known as TOTWGT in the TIMSS international databases.

## Participation Rates

Because nonparticipation can result in sample bias and misleading results, it is important that the schools, classes, and students that are sampled to participate in TIMSS actually take part in the assessments. To show the level of sampling participation in each country, TIMSS calculates both unweighted participation rates (i.e., based on simple counts of schools, classes, and students) and weighted participation rates based on the sampling weights described in the previous section. Unweighted participation rates provide a preliminary indicator that may be used to monitor progress in securing the participation of schools and classes, whereas weighted participation rates are the ultimate measure of sampling participation.

TIMSS reports weighted and unweighted participation rates for schools, classes, and students, as well as overall participation rates that are a combination of all three. To distinguish between participation based solely on originally sampled schools and participation that also relies on replacement schools, school and overall participation rates are computed separately for originally sampled schools only and for originally sampled together with replacement schools.

## Unweighted School Participation Rate

The unweighted school participation rate is the ratio of the number of participating schools to the number of originally sampled schools, excluding any sampled schools found to be ineligible. A school is considered to be a participating school if at least one of its sampled classes has a student participation rate of at least 50 percent. The two unweighted school participation rates are calculated as follows:
$R_{\text {unw }}^{s c-s}=$ unweighted school participation rate for originally sampled schools only
$R_{u n w}^{s c-r}=$ unweighted school participation rate, including originally sampled and first and second replacement schools

$$
\begin{align*}
& R_{u n w}^{s c-s}=\frac{n_{s}}{n_{s}+n_{r 1}+n_{r 2}+n_{n r}}  \tag{3.14}\\
& R_{u n w}^{s c-r}=\frac{n_{s}+n_{r 1}+n_{r 2}}{n_{s}+n_{r 1}+n_{r 2}+n_{n r}} \tag{3.15}
\end{align*}
$$

## Unweighted Class Participation Rate

The unweighted class participation rate is the ratio of the number of sampled classes that participated to the number of classes sampled, as follows:

$$
\begin{equation*}
R_{u n w}^{c l}=\frac{\sum_{i}^{s+r 1+r 2} c_{*}^{i}}{\sum_{i}^{s+r 1+r 2} c^{i}} \tag{3.16}
\end{equation*}
$$

where $c^{i}$ is the number of sampled classes in the $i^{\text {th }}$ school, and $c_{*}^{i}$ is the number of participating classes in the $i^{\text {th }}$ school. Both summations are across all participating schools.

## Unweighted Student Participation Rate

The unweighted student participation rate is the ratio of the number of selected students that participated in TIMSS to the total number of selected students that should have been assessed in the participating schools and classes. Classes where less than 50 percent of the students participate are considered to be not participating, and so students in such classes also are considered to be nonparticipants. ${ }^{7}$ The unweighted student participation rate is computed as follows:

$$
\begin{equation*}
R_{u n w}^{s t}=\frac{\sum_{i, j} s_{r s}^{i, j}}{\sum_{i, j} s_{r s}^{i, j}+\sum_{i, j} s_{n r}^{i, j}} \tag{3.17}
\end{equation*}
$$

## Overall Unweighted Participation Rate

The overall unweighted participation rate is the product of the unweighted school, class, and student participation rates. Because TIMSS computes two versions of the unweighted school participation rate, one based on originally sampled schools only and the other including replacements as well as originally sampled schools, there also are two overall unweighted participation rates:
$R_{u n w}^{o v-s}=$ unweighted overall participation rate for originally sampled schools only received.
$R_{u n w}^{o v-r}=$ unweighted overall participation rate, including originally sampled and first and second replacement schools

$$
\begin{align*}
& R_{u n w}^{o v-s}=R_{u n w}^{s c-s} \cdot R_{u n w}^{c l} \cdot R_{u n w}^{s t}  \tag{3.18}\\
& R_{u n w}^{o v-r}=R_{u n w}^{s c-r} \cdot R_{u n w}^{c l} \cdot R_{u n w}^{s t} \tag{3.19}
\end{align*}
$$

## Weighted School Participation Rate

The weighted school participation rate is the ratio of two estimates of the size of the target student population. The numerator is derived from the measure of size of those sampled schools that participated in TIMSS and the denominator is the weighted estimate of the total student enrollment in the population. Weighted school participation rates are computed for originally sampled schools and for originally sampled and replacement schools combined, as follows:
$R_{w t d}^{s c-s}=$ weighted school participation rate for originally sampled schools only
$R_{w t d}^{s c-r}=$ weighted school participation rate, including originally sampled and first and second replacement schools

$$
\begin{align*}
R_{w t d}^{s c-s}= & \frac{\sum_{i, j}^{s} B W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}{\sum_{i, j}^{s+r l+r 2} F W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}  \tag{3.20}\\
R_{w t d}^{s c-r}= & \frac{\sum_{i, j}^{s+r l+r 2} B W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}{\sum_{i, j}^{i+r 1+r 2} F W_{s c}^{i, j} \cdot F W_{c l}^{i, j}} \tag{3.21}
\end{align*}
$$

Summations in both the numerator and denominator are over all responding students and include appropriate class and student sampling weights. Note that the basic school weight appears in the numerator, whereas the final school weight appears in the denominator.

## Weighted Class Participation Rate

The weighted class participation rate is computed as follows:

$$
\begin{equation*}
R_{w t d}^{c l}=\frac{\sum_{i, j}^{s+r 1+r 2} B W_{s c}^{i} \cdot B W_{c l}^{i, j} \cdot F W_{s t}^{i, j}}{\sum_{i, j}^{s+r l+r 2} B W_{s c}^{i} \cdot F W_{c l}^{i, j} \cdot F W_{s t}^{i, j}} \tag{3.22}
\end{equation*}
$$

where both the numerator and denominator are summations over all responding students from classes with at least 50 percent of their students participating in the study, and the appropriate student-level sampling weights are used. In this formula, the basic class weight appears in the numerator, whereas the final class weight appears in the denominator. The denominator in this formula is the same quantity that appears in the numerator of the weighted school participation rate for all schools, whether originally sampled or replacement.

## Weighted Student Participation Rate

The weighted student participation rate is computed as follows:

$$
\begin{equation*}
R_{w t d}^{s t}=\frac{\sum_{i, j}^{s+r 1+r 2} B W_{s c}^{i} \cdot B W_{c l}^{i, j} \cdot B W_{s t}^{i, j}}{\sum_{i, j}^{s+r+r^{2}} B W_{s c}^{i} \cdot B W_{c l}^{i, j} \cdot F W_{s t}^{i, j}} \tag{3.23}
\end{equation*}
$$

where both the numerator and denominator are summations over all responding students from participating schools. In this formula, the basic student weight appears in the numerator, whereas the final student weight appears in the denominator. Also, the denominator in this formula is the same quantity that appears in the numerator of the weighted class participation rate for all participating schools, whether originally sampled or replacement.

## Overall Weighted Participation Rate

The overall weighted participation rate is the product of the weighted school, class, and student participation rates. Because there are two versions of the weighted school participation rate, one based on originally sampled schools only and the other including replacement as well as originally sampled schools, there also are two overall weighted participation rates:
$R_{w t d}^{o v-s}=$ weighted overall participation rate for originally sampled schools only
$R_{w t d}^{o v-r}=$ weighted overall participation rate, including sampled, first and second replacement schools

$$
\begin{align*}
& R_{w+d}^{o v-s}=R_{w+d}^{s c-s} \cdot R_{w t d}^{c l} \cdot R_{w t d}^{s t}  \tag{3.24}\\
& R_{w+d}^{o v-r}=R_{w+d}^{s c-r} \cdot R_{w t d}^{c l} \cdot R_{w t d}^{s t} \tag{3.25}
\end{align*}
$$

Weighted school, class, student, and overall participation rates are computed for each TIMSS participant using these procedures.

## Appendix 3A: Sampling Schools

TIMSS employs random-start fixed-interval systematic sampling to draw the school sample, with each school selected with probability proportional to its size (PPS).

To sample schools using the PPS systematic sampling method, the schools from each explicit stratum in the sampling frame are sorted by implicit stratification variables and by their measure of size (MOS), as shown in the example in Exhibit 3.6. The MOS is accumulated from school to school and the running total (the Cumulative MOS) is listed next to each school. The cumulative MOS across the entire stratum (the Total MOS) is a measure of the size of the school population in the stratum (59,614 students in the example).

## First Step: Compute the Sampling Interval

Dividing the Total MOS by the number of schools required for the sample (50 in the example) gives the sampling interval.

- $\mathbf{5 9 , 6 1 4} \div \mathbf{5 0}=\mathbf{1 , 1 9 2 . 2 8 0 0}$

## Second Step: Generate a Random Start

Generate a random number from a uniform ( 0,1 ) distribution and multiply it by the sampling interval. The school whose cumulative MOS contains the resulting number is the first school in the sample.

- $0.5481 \times 1,192.2800=653.4887$
- School 1718, with cumulative MOS of 690, is the first school in the sample.

Third Step: Identify the Next School in the Sample (repeat until all schools have been sampled)

- Add the sampling interval to the number computed in the previous step.
- $653.4887+\mathbf{1 , 1 9 2 . 2 8 0 0}=\mathbf{1 , 8 4 5 . 7 6 8 7}$
- School 0067, with cumulative MOS of $\mathbf{1 , 8 5 5}$, is the second school in the sample.
- Repeat until all schools have been sampled. For example, to identify the third school:
- $1,845.7687+1,192.2800=3,038.0487$
- School 0333, with cumulative MOS of $\mathbf{3 , 0 3 8}$, is the third school in the sample.

## Fourth Step: Identify Replacement Schools

Two replacement schools are identified for each sampled school. The first replacement (R1) is the school that immediately follows the sampled school in the sampling frame, and the second replacement (R2) the school that immediately precedes the sampled school.

## Appendix 3B: School Sampling Design Options to Accommodate Other Samples

TIMSS provides optional modifications to its sampling design for countries that want to maximize or minimize sampling overlap between schools sampled by TIMSS at the fourth and eighth grades as well as for countries that want to minimize overlap between schools sampled for TIMSS and schools sampled for other national or international assessments.

To provide options for countries in designing their school samples, Statistics Canada implements two special sampling procedures. Method A is applied when data collection occurs simultaneously for two or more populations (as is the case in 2019 with TIMSS at fourth grade and eighth grade) and the country wants to control the overlap between the schools. Method B is used primarily to ensure that the TIMSS samples avoid schools sampled for other studies, and also used when Method A is not appropriate.

## Sampling Method A: Sampling Modifications for Simultaneous Data Collection

This procedure stratifies the school population according to whether schools contain students from both populations to be sampled (fourth and eighth grades, for example), or students from one population only (fourth grade only or eighth grade only) as a way of controlling sample overlap. Each school is assigned a measure of size (MOS) based on the number of students in the two populations combined (i.e., fourth grade and eighth grade combined). Schools are sampled according to the sampling design described in this chapter. When selecting schools from strata comprising students from both populations, a country can choose to maximize or minimize the number of schools to be sampled at each grade level.

The example below in Exhibit 3.7 shows a hypothetical country participating in TIMSS at both grades. For reasons of administrative efficiency, the country wants to maximize the overlap between the fourth and eighth grade school samples. The 8,805 schools from the combined school frames (fourth and eighth grades) were first split in three strata and then a school sample of 164 was drawn as shown in the exhibit.

## Exhibit 3.7: Example of Method A - Allocation of School Samples in a Country Participating at Two Grade Levels

| Overlap Strata | Total Sampled Schools | Allocation |  |
| :---: | :---: | :---: | :---: |
|  |  | To TIMSS Grade 4 | To TIMSS Grade 8 |
| Grade 4 only | 14 | 14 | 0 |
| Grade 8 only | 14 | 0 | 14 |
| Grade 4 \& Grade 8 | 136 | 136 | 136 |
| Total | 164 | 150 | 150 |

Choosing as many schools as possible from the Grade $4 \&$ Grade 8 stratum resulted in a sample of 150 schools $(136+14)$ for each grade level, from a total of 164 sampled schools. In this case, both studies were administered in the 136 schools selected from the Grade 4 \& Grade 8 stratum.

This sampling technique was most often used for TIMSS countries and benchmarking participants that had schools with students in both fourth and eighth grade populations, where there was a strong correlation between the measure of size at both grades across these schools, and when school samples could be drawn at the same time.

## Sampling Method B: Sampling Modifications for Sequential Data Collection

Method B was used to minimize overlap with another study such as a national study that also samples schools, and was also used when Method A was not appropriate (e.g., low correlation between MOS for fourth grade and eighth grade, samples not drawn simultaneously). In Method B, schools were sampled using a technique described in Chowdhury, Chu, and Kaufman (2000). As explained by the authors, the method can be used to either minimize or maximize overlap amongst several samples. This method is illustrated below with an example where the aim was to minimize the overlap between a current sample of schools $S_{2}$ and a previously selected school sample $S_{1}$. (For a complete description of the method, readers are referred to the original paper).

Let RL (Response Load) be the number of times a school was sampled from previous samples. In this example, given that there is only one previous sample, RL takes the value 1 if the school was already selected and 0 otherwise.

Given that the RL variable splits the current school frame in two distinct subsets of schools, $S_{1}$ where RL=1 and $\bar{S}_{1}$ where RL=0, we have the following relation:

$$
\begin{equation*}
P_{i}\left(S_{2}\right)=P_{i}\left(S_{2} \mid S_{1}\right) \cdot P_{i}\left(S_{1}\right)+P_{i}\left(S_{2} \mid \bar{S}_{1}\right) \cdot P_{i}\left(\bar{S}_{1}\right) \tag{3.26}
\end{equation*}
$$

where $P_{i}\left(S_{j}\right)$ gives the probability that school $i$ be selected in the sample $\left(S_{j}\right)$, and $P_{i}\left(S_{j} \mid S_{k}\right)$ gives the probability that school $i$ be selected in sample $\left(S_{j}\right)$ given that school $i$ already belongs to $\left(S_{k}\right)$. The idea here is to derive the conditional probabilities in such a way that the unconditional probability of selecting a school in the current sample, $P_{i}\left(S_{2}\right)$, be equal to the expected probability (as defined by the TIMSS sample design).

Note that the first term after the equal sign in equation (3.26) is related to cases where the school response load is 1 , while the last term is related to cases where the school response load is 0 . Therefore, minimizing the sample overlap is equivalent to zeroing the first term. In such case, equation (3.26) becomes:

$$
\begin{equation*}
P_{i}\left(S_{2}\right)=0 \cdot P_{i}\left(S_{1}\right)+P_{i}\left(S_{2} \mid \bar{S}_{1}\right) \cdot P_{i}\left(\bar{S}_{1}\right) \tag{3.27}
\end{equation*}
$$

and consequently,

$$
\begin{equation*}
P_{i}\left(S_{2} \mid \bar{S}_{1}\right)=P_{i}\left(S_{2}\right) / P_{i}\left(\bar{S}_{1}\right) \tag{3.28}
\end{equation*}
$$

In other words, in the current sample $S_{2}$, schools would be selected with the following conditional probabilities:

$$
\begin{cases}0 & \text { if school } i \text { was already selected in the first sample }  \tag{3.29}\\ P_{i}\left(S_{2}\right) / P_{i}\left(\bar{S}_{1}\right) & \text { otherwise }\end{cases}
$$

However, equation (3.26) no longer holds if expression $P_{i}\left(S_{2}\right) / P_{i}\left(\bar{S}_{1}\right)$ is greater than 1 . This can be avoided by setting 1 as an upper bound. We now have the following expression:

$$
\begin{equation*}
P_{i}\left(S_{2}\right)=P_{i}\left(S_{2} \mid S_{1}\right) \cdot P_{i}\left(S_{1}\right)+1 \cdot P_{i}\left(\bar{S}_{1}\right) \tag{3.30}
\end{equation*}
$$

and consequently

$$
\begin{equation*}
\frac{P_{i}\left(S_{2}\right)-P_{i}\left(\bar{S}_{1}\right)}{P_{i}\left(S_{1}\right)}=P_{i}\left(S_{2} \mid S_{1}\right) \tag{3.31}
\end{equation*}
$$

Combining these two results, the conditional probabilities to use when selecting the current sample of schools are given by:

$$
\left\{\begin{array}{l}
\operatorname{Max}\left[0, \quad \frac{P_{i}\left(S_{2}\right)-P_{i}\left(\bar{S}_{1}\right)}{P_{i}\left(S_{1}\right)}\right] \text { if school } i \text { was already selected in the first sample, }  \tag{3.32}\\
\operatorname{Min}\left[\frac{P_{i}\left(S_{2}\right)}{P_{i}\left(\bar{S}_{1}\right)}, 1\right] \quad \text { otherwise }
\end{array}\right.
$$

Note that maximizing rather than minimizing the overlap between two studies can be done by simply zeroing the last term of equation (3.26) rather than zeroing the first term, and following the above logic to get the conditional probabilities. The Chowdhury et al. (2000) method can be generalized to more than two samples as described in their paper.

Further details about the implementation of this method for the countries and benchmark participants can be found in the Sample Implementation chapter.

## DATA COLLECTION PROCEDURES

## CHAPTER 4

## eAssessment System for TIMSS 2019

Mark Cockle Heiko Sibberns

## Introduction

As described in Chapter 1 of this volume, TIMSS 2019 marked the beginning of the transition to eTIMSS-the digital version of TIMSS designed for computer- and tablet-based administration. eTIMSS offered an engaging, interactive, and visually attractive assessment that enabled TIMSS 2019 to better assess complex areas of the mathematics and science frameworks and increase operational efficiency in translation, assessment delivery, data entry, and scoring. Although the aim is to switch completely to the new digital mode in future assessment cycles, in recognition of the different levels of preparation and infrastructure, countries had the option in 2019 of choosing either eTIMSS or paperTIMSS.

In addition to the overarching requirements for a computer-based system that could produce attractive and engaging assessment items while being reliable, flexible, and easy to use, there were a number of other conditions that had to be taken into account in choosing the system:

- The assessment should be capable of operating on tablets as well as on personal computers.
- Assessment delivery should be via USB memory sticks or through a local server approach whereby the assessment software is installed on a local server that can be accessed by a small number of clients (no more than 30). Full internet-based administration was not a requirement for the TIMSS 2019 assessment cycle.
- Because about half the countries were administering the paperTIMSS version, it was important that items developed in the eAssessment system be as similar as possible to their corresponding paper versions, while capitalizing on interactive computer-based features such as drag-and-drop, multi-select, and drop-down menus.
- Beyond the utilization of features just mentioned in developing individual items, the system should also accommodate more extended Problem Solving and Inquiry Tasks (PSIs) designed to simulate real world or laboratory situations in which students could integrate and apply process skills and content knowledge to solve mathematics problems or conduct virtual
scientific experiments and investigations. These tasks would be tailor-made and not have any counterparts in the paperTIMSS assessment.
- Great emphasis also was placed on clarity and ease of use of the student interface, which was to be kept as simple as possible. This meant, for example, that only those tools such as rulers or calculators that were necessary for processing a specific task were available.
- Since the TIMSS assessment has to be translated and adapted to the needs of each country and language while retaining the same user experience, it was important that the system incorporate a preview functionality for checking that the assessment content appears in exactly the way it is intended for the assessment situation.

To meet all of the design requirements and constraints and to adequately take into account the workflow that has been optimized by TIMSS during the last 20 years, it was decided to develop the eTIMSS computer-based assessment system in-house instead of using an existing commercial system or having it developed by an external company. Accordingly, the eTIMSS "eAssessment system" was designed and implemented by the software team at IEA Hamburg, with input from the TIMSS \& PIRLS International Study Center on the user experience/user interface and from IEA Amsterdam on translation issues.

The TIMSS 2019 eAssessment system consisted of a number of integrated software and application modules as follows:

- The Designer is an item authoring system used by the TIMSS \& PIRLS International Study Center to develop the eTIMSS achievement items
- The Assembler was used to group items into item blocks and item blocks into student "item block combinations" (student booklet equivalents)
- The Translation System was used by National Research Coordinators (NRCs) from each country and benchmarking participant to translate the items into their language(s) of instruction and by IEA Amsterdam and the TIMSS \& PIRLS International Study Center for translation and layout verification, respectively
- The assessment Player was used to administer the eTIMSS assessment-present the items on tablet or computer, record students' responses, and upload the data to the IEA servers
- The Data Monitor was used by NRCs and test administrators to check the status of uploaded material and progress of the data collection
- The Scoring System was used by NRCs and their scoring staff to review students' written responses to constructed-response items and score them according to the eTIMSS scoring guides.

## Design and Architecture of the eTIMSS Modules

In considering the description of the TIMSS eAssessment system it is helpful to differentiate among three distinct subsystems: 1) the production system for creating assessment content (the Designer, the Assembler, and the Translation System); 2) the delivery system for administering the test in the test session (the assessment Player); and 3) the retrieval and processing system, for upload of the test data to the IEA servers, scoring, and further data processing.

The following is an overview of the various system components and their interaction.
Designer
The designer was used by staff at the TIMSS \& PIRLS International Study Center to create the digital versions of the standard (non-PSI) items. Exhibit 4.1 shows part of the screen used for the creation of items. In this example, the item includes three separate elements: a Scalable Vector Graphic (SVG) image, a multiple-choice option, and a constructed response field. On the left is a column for item properties, including, amongst other information, the item ID number, testing grade, testing subject, and content domain assessed by the item. These were used for the selection and identification of the item later in the process of assembly and booklet creation, as well as within the Player.

Exhibit 4.1: eAssessment Designer Input Screen for Example Item

The objective in developing the Designer was to create an item authoring system that encompassed existing TIMSS paper item formats (multiple-choice, constructed response etc.), including the stem text, images and so on, but also new item types unique to the electronic environment. These included dropdown menus, drag \& drop, selection (boxes or images), and sorting (boxes or images) item types (see TIMSS 2019 Item Writing Guidelines). To accommodate items where the student had to draw shapes or lines, a line-drawing grid also was introduced.

The Designer included various features that could be used by item developers in creating or customizing items, which was particularly important when dealing with trend items where a close match between the electronic item and the paper version was required. For example, the application of labels to images could be made above, below, or to the left or right of an image, or tables could be inserted with invisible lines in order to place objects within columns to obtain a more precise layout.

To accommodate items that included images with overlaid text, which are very common in TIMSS, an SVG feature was introduced. This provided great versatility in working with images such as line or bar charts that had overlaid text (e.g., axes labels) that later had to be translated.

It should be noted that the extended Problem Solving and Inquiry Tasks (PSIs) were substantially more complex and interactive than the standard eTIMSS items, and so were constructed independently of the Designer and subsequently combined into item block combinations (or eAssessment "booklets") by the Assembler.

## Assembler

The Assembler module was used by IEA Hamburg and the TIMSS \& PIRLS International Study Center to combine assessment items into blocks, and then item blocks or PSI tasks into item block combinations along with the assessment directions and eTIMSS questionnaire, in accordance with the TIMSS 2019 matrix-sampling booklet design (see TIMSS 2019 Assessment Design). It was also within this module that the allocation of the booklet number to the instrument was made. Exhibit 4.2 shows part of the Assembler window, and illustrates how a completed booklet has been constructed with six elements; on the left are available blocks that were not included in the construction of this booklet.

Exhibit 4.2: Combining Item Blocks and Directions in an Assembler Window

Once items were assembled into item blocks they could be released country-by-country into the Translation System, where countries and benchmarking participants could begin translation. Item blocks could be "released" for translation one by one as they were completed in the Designer. However, all items in the block had to be complete before the block could be released. If any item in the block was still in the state "In Progress," the release was prevented to ensure that only the approved material would be presented to those using the Translation System. A consequence of this "whole block" approach was that if a minor change had to be made to an item after the block had been released, the entire block had to be withdrawn from the released state until such time as the change had been made and the item could be reassigned to the block.

## Translation System

The Translation System was a critical part of the eAssessment system and was used by multiple parties. These included IEA Amsterdam and IEA Hamburg during the setup, NRCs and translators from the participating countries, translation verifiers employed by IEA Amsterdam, and layout verifiers from the TIMSS \& PIRLS International Study Center. Although the primary purpose of the system was to enable translation, verification, and documentation of any deviations from the original international English source version, the system also enforced the appropriate workflow by a combination of user rights applicable at different stages of the process leading to the final, approved, translations.

Exhibit 4.3 shows an example of the translation window, where the eTIMSS Questionnaire title has been translated into German. Note that three fields are displayed-the original English source text in the top field, the current translation in the bottom field (only this field is directly editable), and a "track changes" field to show the changes in a color-coded manner. Additional fields could be shown, for example, to compare a current translation with an earlier version submitted for translation verification.

## Exhibit 4.3: Example Translation from the Translation System

| qt.page1.pageHeader | 06.09 .2018 local system | $</\rangle$ | a |

| eTIMSS-Questionnaire-Fragebogen | Track Changes |  |  |
| eTIMSS-Fragebogen | Current Transtation |  |  |

Exhibit 4.4 shows the translation editor, which enabled making a range of layout and font changes as well as inserting HTML commands, symbols, or mathematical structures such as fractions.

## Exhibit 4.4: Translation System Editor

Translators also had the option to export the international source text elements in an XLIFF format, which could be used in standard translating programs for increased efficiency. This required the translations to be imported back into the Translation System and formatted for translation verification and layout verification.

The guiding principle in designing the Translation System was to define a process similar to that used in translating and verifying paperTIMSS assessment instruments. The process began by releasing a copy of the international English version of the achievement items into a separate language-specific folder for each country, followed by a workflow consisting of a series of status indicators indicating the progress of the translation and verification that were set by the various parties involved in the process. These status indicators were defined by IEA Hamburg and the TIMSS \& PIRLS International Study Center as follows:

- In Translation \& Adaptation: The initial, default status following release to the country
- Ready for Translation Verification: After completing translations, all blocks had to be set to this status when the translated materials were ready for translation verification
- In Translation Verification: Set by IEA Amsterdam when translation verification began, which locked the system for editing during the process
- In NRC Translation Approval: On completion of translation verification, the system was unlocked to allow the NRC to apply edits based on feedback from the translation verifier
- Ready for Layout Verification: After translation verification was complete and all edits applied, all blocks were set to this status to submit materials for layout verification
- In Layout Verification: Set by the TIMSS \& PIRLS International Study Center when layout verification began, which locked the system for editing during the process
- In NRC Layout Approval: On completion of layout verification, the system was unlocked to allow further editing by the NRC based on feedback from the TIMSS \& PIRLS International Study Center
- Instrument Finalized: The final status, assigned by the NRC, indicated that the materials had completed all verification steps and were ready for assessment Player production.

At each step along the way, comments could be left to document the process. The idea was to mimic the workflow and fields used in the National Adaptation Forms for the paper version. In the particular case of translation verification, additional labels were available to indicate specific errors or deviations found/corrected, including a "severity code" assigned by verifiers to each deviation to assist the NRC in deciding whether to accept or reject suggestions made by the verifier (see Instrument Translation and Layout Verification). In general, comments were labeled so as to indicate for whom they were intended. For example, a layout verifier could leave comments in the system for the attention of the NRC, in which case the label would have been "Layout."

A preview feature was available for all users to display items exactly as they would appear within the final Player. This was especially useful during layout verification, allowing as it did comparison with a preview of the original (untranslated) source version.

## Player

The assessment Player is the software that the student interacts with while taking the eTIMSS assessment. The Player presents the assessment items to the student and uploads the student response data to IEA's data servers. After translation and layout verification were successfully completed, a customized version of the Player was produced for each language of instruction in each country. This sometimes required last-minute adjustments to the layout by IEA Hamburg before supplying the Player to the countries.

To access the Player, the student or the test administrator entered the login credentials assigned to that student. These consisted of a unique ID number and password which incorporated a two-digit code that determined the specific assessment item block combination assigned to each student. After entering the correct login credentials, the test administrator read aloud a test administration script that instructed students to enter a four-digit code to begin the test directions introducing students to the various types of items. After working through the directions, students were instructed to enter another four-digit code to begin working on the first part of the assessment. Following a short break, a third four-digit code provided access to the second part of the assessment. Finally, a fourth four-digit code allowed access to the short eTIMSS questionnaire.

Exhibit 4.5 shows the Player user interface, with an example science item. The students navigated through the assessment using the green forward/backward arrow buttons or via the navigation bar on the left side of the screen. The navigation bar records the students' progress through the assessment, showing which items have been completed and which have been omitted or not yet attempted. There also is a timer showing the remaining time.

## Exhibit 4.5: eTIMSS Assessment Player User Interface

The software development criteria for the Player encompassed multiple, sometimes competing elements. The key elements were speed of operation, security, and consistency of user experience.

## Speed of Operation

Several design factors were involved in producing a Player that responded smoothly and produced the minimum delay when navigating between items:

- The content (directions and items) to be displayed to the student was preloaded directly after the login screen, so that only response storage processes took place during the test session
- The Player database was mirrored in memory for faster performance
- The format of the data saved was as parsimonious as possible to maximize performance when saving and uploading data.

## Security

To ensure the security of the student data and test items:

- The Player was configured to run within a "sandbox"-a virtual space in which software can be run securely-to isolate the Player in a restricted memory range
- Contents of the sandbox were automatically deleted after the testing session.

## Consistency of User Experience

To ensure the Player operated the same way for all countries and languages:

- The Player exhibited a close to identical display on Firefox or Chrome browsers or with either the Android or USB Players
- Country- and language-specific CSS files were available to make final layout and font adjustments
- Right-to-left languages had automatically reversed layout, with the ability to revert individual elements back to left-to-right format.

The Player software consisted of an executable file and two or three additional files: 1) a countryspecific "Player Model" SQLite database containing the translations and the item block combination structure; 2) a template SQLite database file as the basis of the results database; and, optionally, 3) a CSS file in case layout or font changes were required.

The results database was created for each student at login time, and included information about the particular culture (country/language combination), as well as the student ID and a reference to the country in the name of the database file itself. It should be noted that the results database is the repository of not only the students' responses to the items but also the timestamped events that reflect the process of working on the assessment, such as navigating between screens, using interface tools, and changing responses to items.

To upload data from the Player to the IEA servers, a menu option in the Player opened a separate upload page. A list of all the results databases in the default location (the same folder level as the Player executable) was displayed, along with buttons to "Upload Data" and "Refresh." For those using a Player to upload data from multiple USBs, it was possible to add additional results databases to the list. Clicking "Upload Data" triggered the upload process to start, and a color-coded bar showed the number of successful and unsuccessful uploads.

On completion of an upload, an acknowledgement was sent back to the Player client performing the upload confirming a successful (or rarely, unsuccessful) data transfer. Databases successfully uploaded were moved to an "uploads" subfolder and flagged to ensure that they would not be uploaded again. Databases not successfully uploaded remained in the list for a further attempt to be made.

## Data Monitor

The Data Monitor was provided to enable NRCs and test administrators to further check the status of uploaded data and to monitor overall progress during the data collection. As shown in Exhibit 4.6, the Data Monitor enabled all records for a specific grade and country to be viewed, including information regarding the student ID, the record creation time (the time the student logged into eTIMSS Player), and the time of uploading.

Exhibit 4.6: Example Information from the Data Monitor

| Country | - | Culture $\uparrow$ | IDSCHOOL $\uparrow$ | IDCLASS $\uparrow$ | IDSTUD © | Module (-) | File Size © $\uparrow$ | Record Created © | Record Uploaded (T) |  |

## Scoring System

The IEA CodingExpert software, consisting of an Administration Module and a CodingExpert Client, was the online scoring system used by NRCs and their scoring staff to score the eTIMSS constructed response items. The Administration Module enabled scoring administrators from each country and benchmarking participant to activate scorer accounts, assign scorers to items, set up and distribute training materials, distribute student answers, and monitor the progress and quality of the scoring. Scorers used the CodingExpert Client to score the student item responses assigned to them by the scoring administrator.

The Scoring System was an independent online system, working in tandem with local client software that supplied the students' responses to the scorers along with contextual information such as the translated item stem. In addition to the standard constructed response questions familiar from paper scoring, the eTIMSS Scoring System had to accommodate responses from unique, digitally-enhanced item types in the Problem Solving and Inquiry Tasks, as well as display screenshot images from the linedrawing items.

## Preparing Data for Scoring and Processing

Some pre-processing steps were required to prepare data in a suitable format for import into the Scoring System and to enhance the efficiency of the human-scoring process. Data uploads from the eTIMSS Players were processed at IEA Hamburg by several data servers that received and then extracted the raw data from the uploaded SQLite databases into the "central" SQL database for all countries. This new structure contained a separate database for each country and grade, including all data from the original

SQLite databases with the addition of identifiers relating to the import of data and additional fields for scoring purposes.

Although scoring supervisors controlled the distribution of responses to scorers within countries, the responses themselves became available in the system soon after upload (with some delay due to the asynchronous handling of the import to the central database and thence to the scoring system). To avoid unnecessary scoring, therefore, it was essential that any duplicates in the central database were dealt with before import to the scoring system. In addition to measures to prevent a database from being uploaded a second time from the client side, checks were made to the results database creation date and content to ensure any possible duplicates were flagged before import. There were, however, some kinds of duplicate records that could be legitimate. Two databases with the same student ID but with different creation times could have originated in several scenarios. For example, this could be simply a case of the test administrator mistakenly using the same ID twice for two different students, or an interruption in the assessment may have led to part 1 being conducted from one USB stick and part 2 from a second. Such cases needed to be reconciled by IEA Hamburg's data processing procedures.

When scoring was completed, the student response data were transferred to tables prepared for import into the data processing system (DPE) employed at IEA Hamburg for all large-scale international assessments. Here data from the various other TIMSS sources, such as the student questionnaire or online context questionnaires, were merged together, using the IDs from the WinW3S database as the key. Following an intensive series of quality control checks to identify and reconcile any inconsistencies, the data were exported to SPSS and SAS data files for distribution to countries as part of the International Database (see Chapter 8: Creating the TIMSS 2019 International Database).

## eTIMSS Assessment Delivery Methods

Countries participating in eTIMSS could choose from the following three methods for delivering the assessment:

- USB delivery involved running an executable file from a USB flash drive preloaded with the eTIMSS Player
- Tablet delivery involved running the assessment Player directly from an application on an Android-based tablet
- Local server method involved the use of the same Player as for the USB delivery, but run from a server on a local area network, with the client computers running a browser to connect to the server.

In practice, most countries focused on one standard method of delivery, with other options only used as exceptions due to special circumstances within schools.

## USB Delivery

USB delivery involved running an executable file from a USB flash drive preloaded with the eTIMSS Player. Test administrators were instructed to run the executable, which would open the program on a main menu. On clicking the menu "Start eTIMSS" the program would present a login screen in "kiosk" full screen mode-a semi-locked-down state where some key strokes are blocked and students are unable to access or see the browser address bar.

The suitability of computers for this mode of delivery was determined by running a "system check" program, which returned a clear yes/no indication on parameters based on screen resolution, operating system, CPU speed and available memory, as well as a USB transfer rate check. This system check was provided as a stand-alone program for checking computer compatibility ahead of administration, but was also a module of the USB eTIMSS Player itself, for use on the day of testing.

Following the test session, the test administrator could use an escape code to return to the main menu in order to upload the results. It was recommended to perform the upload as soon as possible following the assessment, but it was also possible to conduct consecutive test sessions for several students and then upload these together at once. Further, it was possible to copy the results databases from several student USB flash drives to one single drive and use that to perform the upload function.

## Tablet Delivery

Tablet delivery involved running the assessment Player directly from an application on an Androidbased tablet. This application needed to be first installed on the tablet from an .apk (Android Application Package) file. Once installed, the application was available from the tablet home screen. The icons for these were labeled in such a way that fourth grade and eighth grade versions could be distinguished.

On tapping the appropriate application icon, a login screen would appear in full screen. In contrast to the USB version, it was not possible to prevent operation of the home button due to restrictions of the Android operating system.

A system check for tablets was provided via the Google Play Store as a separate application; there was no system check within the standard application. Minimum requirements comprised screen resolution (identical to the minimum for the USB application), version of operating system (Android 5.0.2 or higher), available storage, CPU speed, and available memory.

Following the test session, the application would return to the login screen. A button at the bottom of the screen allowed the upload of the assessment data to take place given the entry of a four-digit password. If multiple students had taken the eTIMSS assessment since the last upload, data for all these students would be transmitted.

## Local Server Method

The local server method was a feature of the USB Player. With the Player program stored on a local drive of a PC, it was possible to start the program as with the standard USB from the main menu. An option then enabled the test administrator to set up the PC as a server and enable computers connected to the local network to connect to this, displaying the assessments in a browser (the Chrome browser was the preferred option).

The minimum specifications for the server computer were above those for standard USB delivery, and no system check was available to test suitability. Therefore the following minimum requirements for the server PCs were defined in order to determine if a machine was able to run the Player successfully:

- OS: Windows 8 or higher
- Processor speed: 2.2 GHz
- Memory: 8GB
- Available storage space: 10 GB on SSD drive
- Administrator rights.

The upload procedure was similar to the USB method, with the additional step of stopping the server-client service. Once this was done, the results from all students could be uploaded at once.

## Description of eAssessment Data

The assessment Player recorded student item responses as well as other actions taken by the student and the data were stored in a SQLite database. Student actions were broken down into timestamped events that recorded process data such as navigation behavior and tool use, but also messages to the student that were created by the system (e.g. time remaining towards the end of the test). The student responses and event data were stored separately, with the item responses in a "response table" and the events in an "event table." There were also auxiliary tables containing the student ID together with the language in which the assessment was administered and information about whether the data had already been uploaded to the IEA server. Other tables were used for error handling.

Each item response or event was stored with both general attributes and attributes specific to that response or event. The following general attributes were recorded:

- Two timestamp parts: The first recorded events and item responses in Unix time and gave the elapsed time in seconds since January 1,1970 . Since a more precise time information was needed for event data, the second timestamp added the milliseconds.
- A sequential number recording the correct sequence of actions: This number reflected the exact order of events and responses and had to coincide with the sequence obtained using the timestamp information.
- A screen ID number: This number indicated the specific screen (or item) on which the response was saved or event occurred.
- A page identifier: Due to the rotation of item blocks within booklets, an item could be displayed in different positions in the assessment. Therefore it was necessary to also include a "page number" as a general attribute.
- An item ID number: For recording responses, the item identifier referred to the particular item or item input (e.g., keyboard field) on the screen. This number corresponded to a given "raw variable name" specified by the TIMSS \& PIRLS International Study Center.
- An event-type ID number: For recording events, using ID numbers instead of names helped to minimize data traffic during the assessment administration. A separate reference look-up table held the actual event names that corresponded to the event-type ID numbers.
- A response ID number: For recording responses, this identifier indicated if a response was changed later during the response process. It showed the sequential number (ID) under which the subsequent answer was saved. The final answer the student gave to an item was marked with a "NULL" value for this field.

## Item Responses

In the response table, each response was stored in a separate record. The response table held the entire response history of each item the student worked on. All item responses were stored as one or more records with string of characters indicating the student response. This could be a single number, but also an extended string containing information about drawn lines or the dragging and dropping of objects. In addition, the student response table contained typed student responses that were later transferred to the Scoring System for human scoring, along with screenshot images of responses from the line-drawing tool. Responses that did not need human scoring were machine scored. For these responses, a set of detailed scoring rules provided by the TIMSS \& PIRLS International Study Center were incorporated in a scoring algorithm and applied to each response to determine the appropriate score.

## Event-Specific Attributes

In addition to the general attributes, attributes specific to each event were stored as JSON objects. JSON objects in general hold for each attribute the name of the attribute (property) and the value of the property. Exhibit 4.7 shows an example extract from the event table for the "UI:IsLoaded" event type. This event indicates that the appropriate test form was loaded with the first item presented to the student. The event-specific attribute is the "index" which is set to zero for the first page of the test, stores as the JSON object \{"index":0\}.

## Exhibit 4.7: Extract from the Event Table for Event Type "Ul:IsLoaded"

| Event-Type Id | Screen ID | Page Identifier | Information |
| :---: | :---: | :---: | :---: |
| 26 | 13617 | 0 | $\{$ "index":0\} |

## Results, Challenges, and Lessons Learned

In retrospect, it was the right decision to set up the eTIMSS system modularly and to differentiate between the phases of content and item creation, translation, instrument assembly, assessment delivery, monitoring of the data retrieval, and scoring of the responses. In each phase, different roles with the corresponding rights were required. Administration was comparatively easy due to the modular structure.

For the translation and translation verification, it turned out to be very helpful that the eTIMSS system supported the XLIFF format. With the help of XLIFF exports, translators could easily import the texts to be translated into standard translation programs and thus carry out the translations very efficiently.

The preview function, which made it possible to display the translated content as it is displayed in the specific assessment situation, was of great help. In this way, it was possible to react very early if the space allotted for the translation was not sufficient and translations were not displayed at all or incorrectly. In these situations, often manual intervention was necessary through CSS files.

In particular, the right to left (RtL) languages (Arabic, Hebrew) presented multiple challenges. A lot of effort went into producing a standard RtL template that could be applied on request in the Translation System. This template had for example certain images flipped or moved to fit to the style. Despite this template, a lot of manual work needed to be done at IEA Hamburg for adjustments of texts, images and input boxes by way of CSS files to finalize players.

The large number of Players that had to be produced in a very short possible time posed a particular challenge. In total, more than 100 player variants were created, all of which had to be tested before distribution. This work was all managed conforming to the timelines for producing paperTIMSS assessment materials.

## CHAPTER 5

# Instrument Translation and Layout Verification for TIMSS 2019 

David Ebbs<br>Erin Wry<br>Jan-Philipp Wagner<br>Andrea Netten

## Overview

The TIMSS \& PIRLS International Study Center developed the international versions of the TIMSS 2019 assessment instruments, context questionnaires, and procedural manuals in English. Then, using the international source versions, the participating countries translated the materials into their languages of instruction and adapted them to their cultural contexts as necessary. For many countries, identifying the language of instruction, referred to as the "target" language, was relatively straightforward because there is a primary language used in the education system. However, some countries use more than one language of instruction in their education systems, and in these cases, they translated the TIMSS 2019 instruments into multiple languages. These multilingual countries also translated the context questionnaires and test administration scripts for each language assessed. In addition, some countries also translated the home questionnaire into additional languages in order to make the questionnaire more accessible to parents from different backgrounds. The complete scope of the verification process for TIMSS 2019 is fully documented in a subsequent section of this chapter.

As an additional complication for TIMSS 2019, it was the first cycle of TIMSS' two-cycle transition to digital assessment. About half the countries administered TIMSS as a digitally-based assessment (eTIMSS) and the rest as a paper-based assessment (paperTIMSS). To maintain international comparability, the TIMSS items were designed to be as identical as possible between eTIMSS and paperTIMSS. For the eTIMSS achievement materials, the procedures for translation and verification took place in the eTIMSS Online Translation system, part of IEA Hamburg's eAssessment system (see Chapter 4). The translation system was designed to mimic the same overarching procedures of paperTIMSS but also contained additional features for accommodating eTIMSS. These features included a "player preview" mode that
displayed how each item would appear in the player software, an SVG editor to edit images and/or labels on images, a button to duplicate translations that appear in more than one item, and a feature to add comments or document national adaptations.

In addition, countries who participated in eTIMSS administered paper booklets of their trend items from TIMSS 2015 to a subsample of schools, to provide a "bridge" between the two administration modes. Substantial effort was required to maintain consistent procedures for verifying the three types of TIMSS 2019 instruments-eTIMSS, paperTIMSS, and bridge booklets.

To ensure a fair basis for comparing mathematics and science achievement across countries, languages, and contexts; the participating countries followed standardized internationally agreed-upon procedures to translate and prepare their national instruments for data collection (see Chapter 6: Survey Operations Procedures). This process included two stages: translation verification and layout verification. As part of the translation verification process, each country's national instruments underwent formal external review by linguistic and assessment experts. During translation verification, verifiers compared the national text to the international text and provided detailed feedback to improve the accuracy and comparability of the national translations. Once the verification was completed, the National Research Coordinators (NRCs) reviewed the feedback, revised their national materials as needed, and documented their changes. Following translation verification, countries submitted their national instruments to the TIMSS \& PIRLS International Study Center for layout verification. During layout verification, verifiers checked to ensure that all national instruments conformed to the international format and that any national adaptations made to the TIMSS 2019 instruments did not unduly influence their international comparability.

The process of translation verification and layout verification was carried out once for the field test materials and a second time prior to data collection. Before data collection, the process involved verifying any changes made to field test materials and checking the trend materials to make document any changes. In the interest of measuring trends in student achievement over time, the overall process of instrument translation and verification remains consistent from one TIMSS cycle to the next.

The following TIMSS 2019 instruments underwent verification:

- Student achievement items and directions
- Context questionnaires, covers, and directions for the student, home, teacher, and school questionnaires
- Online questionnaire items, covers, and directions (for countries administering questionnaires to parents, teachers, and/or schools online)
- Paper bridge booklets (for eTIMSS countries).

## Providing the Instruments to the Countries for Translation and Adaptation

The TIMSS \& PIRLS International Study Center provided NRCs with the TIMSS 2019 assessment materials based on each country's mode of administration. For countries that administered paperTIMSS, NRCs received electronic files consisting of the paperTIMSS achievement materials, guidelines for adaptation, and National Adaptation Forms for documenting each step of the adaptation, translation, and verification processes. For countries that administered eTIMSS, the NRCs received digital versions of all achievement items via the eTIMSS Online Translation System, as well as PDF versions of the eTIMSS achievement blocks, guidelines for adaptation, and instructions and tutorial videos on using the eTIMSS Online Translation System. Additionally, trend countries participating in eTIMSS also received electronic files consisting of the TIMSS 2019 "bridge booklet" production files and instructions on applying their trend translations to their national bridge booklets.

As part of the TIMSS assessment design, each "block" of assessment items appeared in two achievement booklets or two eTIMSS "item block combinations" at each grade level. Therefore, the component parts of the booklets/item block combinations (item blocks and directions) were prepared as separate files for translation and translation verification. This approach allowed countries to translate each component only once. Following translation verification, countries were required to assemble their national paperTIMSS or "bridge" blocks, covers, and directions into booklets to be reviewed during layout verification. To assist in this process, the TIMSS \& PIRLS International Study Center provided NRCs with detailed manuals and instructional videos, support materials for right-to-left languages, and instructions for booklet assembly. For eTIMSS, digital item block combinations were assembled through IEA's eAssessment System.

In addition to the achievement materials, all countries also received electronic files consisting of the international versions of the context questionnaires, guidelines for context questionnaire adaptation, and National Adaptation Forms for documenting the translation, adaptation, and verification processes for the questionnaires. For countries that chose to administer the home, teacher, or school questionnaires online, IEA Hamburg provided access and instructions for using the Online SurveySystem (OSS) to create, administer, and monitor online versions of the questionnaires.

## Guidelines for Translation and Adaptation

The TIMSS \& PIRLS International Study Center provided guidelines for translating and adapting the TIMSS 2019 instruments. The purpose of the guidelines was to ensure that, when countries translated and adapted the international versions, the meaning and difficulty level of the instruments remained the same. All participating countries were expected to follow these guidelines, including countries that administered the TIMSS 2019 instruments in English or used the Arabic source versions.

In accordance with the guidelines, translators and reviewers ensured that:

- The translated texts had the same register (language level and degree of formality) as the source texts
- The translated texts had correct grammar and usage (e.g. subject/verb agreement, prepositions, verb tenses, etc.)
- The translated texts did not remove text from the source text and did not clarify or add more information
- The translated texts had equivalent qualifiers and modifiers appropriate for the target language
- Idiomatic expressions were translated appropriately, not necessarily word for word
- Spelling, punctuation, and capitalization in the target texts were appropriate for the target language and the country's national context.

After the field test, the TIMSS \& PIRLS International Study Center provided NRCs with a list of changes made to the international versions that they could refer to while preparing their assessment instruments for the main data collection. This information helped minimize the translation burden by highlighting the necessary changes to the translations before data collection.

## TIMSS 2019 Arabic International Reference Version

As has been the practice since 2007, Arabic reference versions of the TIMSS 2019 instruments were made available to participating Arabic-speaking countries to serve as a starting point for preparing their national instruments. The Arabic reference versions were first created for the field test, and then updated by the same team of experts for the main data collection. This was done both for paper and digital versions of the assessment.

In TIMSS 2019, Arabic reference versions were offered for the following materials:

- Grade 4 achievement instruments
- Grade 4 less difficult mathematics achievement booklets
- Grade 8 achievement instruments
- Grade 4 context questionnaires for students, parents, teachers, and schools
- Grade 8 context questionnaires for students, teachers, and schools

The initial translation of the TIMSS 2019 instruments into Arabic was conducted in accordance with the general guidelines for translation and adaptation. The translation was produced by a team of linguists (two expert translators, one reconciler, and one proofreader) from BranTra, an independent translation agency based in Brussels, Belgium. The translators produced two separate translations that were reviewed
and compared against one another. In the case of differences between the two translations, the reconciler selected the most appropriate translation for use in the field test instruments. The resulting draft versions then underwent a second review by experienced NRCs to assess the content and terminology used in specific school subjects at the target grades in a variety of Arabic-speaking countries. Upon completion of the content review, the recommendations were taken into consideration and the translations were revised accordingly. The final translations were then sent to the TIMSS \& PIRLS International Study Center to produce the right-to-left Arabic reference materials.

The TIMSS \& PIRLS International Study Center used the Middle Eastern Version of Adobe ${ }^{\oplus}$ InDesign ${ }^{\circledR}$ software to create the paper Arabic-reference production files with CopyFlow Gold ${ }^{\oplus}$ to import the translation from rich-text format (RTF) into InDesign. After importing the translations, the TIMSS \& PIRLS International Study Center applied fonts, styles, and graphics to the instruments and reviewed the materials to ensure that the translations and layout resembled the international version aside from the right-to-left format. Before the release of the TIMSS 2019 Arabic paper reference versions, an additional optical check was performed to verify the layout of the Arabic version and eradicate any remaining errors or issues that occurred during the import process. The multiple stages of translation and review of the Arabic reference instruments ensured that they were an adequate starting point for Arabic-speaking countries to use in preparing their national versions.

For eTIMSS, the Arabic reference translations were imported into the eTIMSS Online Translation System for Arabic-speaking countries that requested to start with this source version. All graphics were automatically flipped and countries were given instructions on how to revert this if they required certain graphics to be viewed left-to-right in their national education context. Further assistance was provided to the eTIMSS Arabic-speaking countries during layout verification for any right-to-left issues that NRCs were not able to adjust themselves.

## Blocks of Achievement Items Designated to Measure Trends

According to the TIMSS design, about two-thirds of the items are carried over from one cycle to the next for the purpose of measuring changes in student achievement over time. Therefore, TIMSS 2019 included some items previously used in TIMSS 2015 and 2011. To ensure the quality of measuring TIMSS trends, the trend items must identical from cycle to cycle. For countries that previously participated in TIMSS 2011 or TIMSS 2015, the TIMSS 2019 trend blocks (including paper bridge booklets) were reviewed during translation and layout verification in comparison with those from the last cycle in which the country participated. If a country determined that changes to an item in a trend block were absolutely necessary (e.g., in order to correct a mistranslation discovered in a previous version), they were instructed to document the change for further review during the verification process. Trend items that underwent changes were not included in the scaling process or the estimation of the achievement scores for that country.

## National Adaptations Forms

Each country prepared one National Adaptations Form (NAF) for each set of paperTIMSS achievement instruments and/or set of questionnaires in each language in which they were administered. NAFs are Excel documents formatted to contain the translations, adaptations, and verification history of each set of national instruments administered on paper. When countries translated and adapted their national paper instruments, the NAFs were filled out by the translators, reviewers, and NRCs. Documenting an adaptation in the NAF requires entering the identifying information (location and/or question number), an English back translation of the adaptation, and recoding instructions (if applicable). During verification, the verifiers reviewed the documentation in the NAFs and recorded any feedback. NRCs were responsible for updating the documentation within the NAFs after each round of international verification. To ease the process of documentation and review, the NAFs include designated areas for each stage of instrument preparation and verification.

For eTIMSS, NAFs were not external worksheets but instead built into the eTIMSS Online Translation System. All national adaptations and documentation for the eTIMSS instruments, as well as feedback from the verifiers was recorded directly into the eTIMSS Online Translation System. For archiving purposes, the translation system had a function to export all documentation including translations, adaptations, and comments from the translators, verifiers, and NRCs.

Countries administering eTIMSS were also provided with Bridge Verification Forms for the paper bridge booklets. Because the bridge booklets were comprised of each country's trend blocks and did not contain any new translations or adaptations, the Bridge Verification Forms were a simplified version of the NAF. These forms did not need to be filled out by NRCs but, rather, were used by the verifiers to document any deviations from trend and any layout issues noted during verification.

## Scope of Translation and Layout Verification in TIMSS 2019

For many countries, identifying the language of assessment, referred to as the "target" language, was relatively straightforward because there is a primary language used in the education system. However, some countries use more than one language of instruction in their education systems, and in these cases, they translated the TIMSS 2019 instruments into multiple languages. These multilingual countries also translated the context questionnaires and test administration scripts for each language assessed. In addition, some countries also translated the home questionnaire into additional languages in order to make the questionnaire more accessible to parents from different backgrounds.

For TIMSS 2019, 64 countries and 8 benchmarking participants prepared a total of 144 sets of achievement instruments and 145 sets of background questionnaires in 50 languages. ${ }^{1}$ The instruments

[^1]were translated into 50 different languages across 58 participating countries and 6 benchmarking entities at the fourth grade, and across 39 countries and 7 benchmarking entities at the eighth grade. Of these participants, 31 countries and 4 benchmarking entities administered the TIMSS 2019 instruments in more than one language. The most common languages used were English (24 countries) and Arabic (10 countries).

Exhibits 5.1, 5.2, and 5.3 lists the target languages used for the TIMSS 2019 fourth grade assessment, the fourth grade less difficult mathematics assessment, and the eighth grade assessment, respectively.

## Translation and Translation Verification

## Translators and Reviewers

All countries and benchmarking participants were advised to hire highly qualified translators and reviewers well suited to the task of working with the TIMSS materials.

Essential qualifications for translators and reviewers included:

- Excellent knowledge of English
- Excellent knowledge of the target language
- Experience in the country's cultural context
- Experience translating texts in the subject areas related to the TIMSS assessment (mathematics and science).

The primary responsibility of the reviewer was assessing the readability and accuracy of the translation for the target population. In addition to excellent language skills and knowledge of the country's cultural context, reviewers were expected to have experience with students in the target grade (preferably as a school teacher).

In cases where several translators and reviewers were needed to distribute the work, NRCs were responsible for maintaining the consistency of the translations within and across instruments. Countries that administered the assessment in more than one language were advised to employ translators and reviewers that were highly proficient in the various languages to ensure the consistency of the translations and adaptations across different language versions.

## Translation and Adaptation of the Achievement Instruments

One of the main challenges in translating TIMSS achievement blocks is finding appropriate terms and expressions in the target language(s) that convey the same meaning and style of text as the international version. When adapting and translating expressions with more contextually appropriate terms, translators ensured that the meaning and difficulty of the item remained the same as the international version. In particular, it was important that adaptation/translation did not simplify or clarify the text in such a way as to provide a hint or definition of the meaning of a question. Translators also ensured the consistency of adaptations and translations from item to item. For multiple-choice items, translators were instructed to pay particular attention to the literal and synonymous matches of text in both the question stem and answer options. Any matches in the international version were required to be maintained in the translated national version.

Although NRCs were strongly advised to keep adaptations to a minimum, some adaptations were necessary in order to prevent students from facing unfamiliar contexts or vocabulary that could hinder their ability to read and understand the item. For example, a reference to the working week as Monday to Friday might be adapted according to national customs. Similarly, a word such as "flashlight" in American English would be adapted to "torch" in British English. In TIMSS 2019, most of the adaptations were in respect to national conventions of measurement (e.g. metric vs imperial units), mathematical notation (e.g. decimal separator, multiplication sign), punctuation, and expressions of date and time. In addition, fictional names of characters and places were modified to similar names in the target language. When adapting the names of fictional cities or towns, translators were instructed not to use real names of places to prevent student responses' from being influenced by their perceptions and knowledge of the real locations.

Within the TIMSS items, some terms were not to be changed or adapted beyond translation. Examples included proper names of actual people and places, as well as the fictional currency "zed" which is used in TIMSS items to denote currency. To aid in the standardization of common adaptations across countries, the TIMSS \& PIRLS International Study Center provided a list of specific examples of acceptable and unacceptable adaptations, including a list of measurement conversions.

## Translation and Adaptation of the Context Questionnaires

Translation procedures for the questionnaires differed from the achievement blocks in that participating countries were required to adapt some terms to ensure that questions were appropriate for the national context and education system. The terms requiring adaptation were listed in angle brackets in the international version with a description of what country-specific information was needed. For example, <language of test> and <fourth grade> would be adapted to the actual language and grade in which the assessment is administered-in the Netherlands, these terms would be replaced by equivalents "Nederlands" (Dutch) and "groep 6" (grade 4).

The guidelines for translation and adaptation contained detailed descriptions of the required questionnaire adaptations, including the intent of each adaptation to help translators select the appropriate national term or expression to convey the intended meaning. For TIMSS 2019, the main difficulties encountered in adapting the questionnaires involved terminology, specific educational contexts, and, for a few countries, consistency across multiple languages of administration.

Countries were permitted to add a limited number of questions to the questionnaires that were of national interest. To avoid influencing responses to the international questions, NRCs were advised to place these national questions at the end of the corresponding module or questionnaire and to ensure these questions adopted the same format as the rest of the questionnaire. All national questions required approval by the TIMSS \& PIRLS International Study Center before inclusion in the final questionnaires.

## International Translation Verification

After the instruments were translated and adapted, they were submitted to IEA Amsterdam for translation verification. For TIMSS 2019, the international translation verifiers were responsible for reviewing and documenting the quality of the national instruments and their comparability to the international instruments.

The required qualifications for international translation verifiers were:

- Fluency in English
- Mother tongue proficiency in the target language
- Formal credentials as translators working in English
- University-level education and (if possible) familiarity with the subject area
- Residency in the target country, or close contact with the country and its culture.

IEA Amsterdam in collaboration with cApStAn Linguistic Quality Control trained the international translation verifiers and provided them with a comprehensive set of instructional materials to support their work. For TIMSS 2019, web-based seminars were used to train and provide verifiers with information about TIMSS and the assessment instruments. Each verifier received a document containing the description of the adaptation and translation guidelines, the relevant manuals and instruments, and a document with the directions and instructions for reviewing the national instruments and documenting deviations from the international version.

## The Translation Verification Process

The instruction and training given to the verifiers emphasized the importance of maintaining the same meaning and difficulty level of the translations as in the international versions and ensuring that translations and adaptations were adequate and consistent within and across national instruments. The translation verification process involved:

- Checking the accuracy, linguistic correctness, and comparability of the translation and adaptations of the achievement items and questionnaires
- Documenting any deviations between the national and international versions, including additions, deletions, and mistranslations
- Suggesting an alternative translation/adaptation to improve the accuracy and comparability of the national instruments.

Verifiers provided feedback on the quality of the translated and adapted texts directly in the instruments, in the accompanying NAFs, and/or in the eTIMSS Online Translation System. Verifiers were asked to correct the text of the assessment items and questionnaires and/or to add notes specifying
errors using either "Sticky Notes" in Adobe PDFs, "Track Changes" and "New Comment" functions in Microsoft Word or the "Add comment" button in the eTIMSS Translation System.

For paper-based instruments, all comments viewed by the verifiers as major issues or deviations in the adaptation/translation were entered in the NAF. For eTIMSS achievement materials all verifier comments were recorded in the eTIMSS Online Translation System. All verifier comments were accompanied by a code to help NRCs understand the severity and type of deviation of the translated text from the international version (see Exhibit 5.4). Translation verifiers were also instructed to review all adaptations and check whether or not the adaptations were correctly documented and implemented for review by the NRC and the TIMSS \& PIRLS International Study Center.

## Exhibit 5.4: Translation Verification Feedback Codes for TIMSS 2019

The criteria for coding are as follows:
CODE 1 indicates a major change or error. Examples include the omission or addition of a question or answer option; incorrect translation that changes the meaning or difficulty of the item or question; and incorrect order of questions or answer options in a multiple-choice question.
If in any doubt, verifiers are instructed to use CODE 1? so that the error can be referred to the TIMSS \& PIRLS International Study Center for further consultation

CODE 2 indicates a minor change or error, such as a spelling or grammar error that does not affect comprehension.

CODE 3 indicates that while the translation is adequate, the verifier has a suggestion for an alternative wording.

CODE 4 indicates that an adaptation is acceptable and appropriate.

## Translation Verification of the Trend Assessment Blocks

For countries assessing changes of student achievement over time, the international verification procedures included a so-called trend check of the achievement instruments to ensure that the trend items had not changed. For countries administering eTIMSS, this included a check of the bridge booklets against the national trend versions.

As part of the trend check process, translation verifiers checked that each of the trend items used in the current TIMSS cycle remained identical to the trend items as they were administered in the previous cycle and documented any differences in content or wording.

The verifiers were instructed to record any discrepancies found in the trend items in the NAF, eTIMSS Online Translation System, or Bridge Verification Form. NRCs were required to carefully review all discrepancies and discuss any proposed changes with the TIMSS \& PIRLS International Study Center.

## Review of International Translation Verification Feedback

Upon completion of international translation verification, the NRCs were responsible for responding to the translation verifiers' feedback by either accepting, modifying or rejected suggested changes to the adapted and/or translated text. Some of the typical errors identified by the verifiers during translation
verification included mistranslations, omissions/additions of text, inconsistent translations, gender agreement, and grammar. Some of the domain-specific concepts in mathematics and science were a particular challenge to translate for some languages. The constructive feedback from the verifiers aided NRCs in revising the materials and in improving the quality of their national versions in line with the translation guidelines for TIMSS 2019.

## Layout Verification

Following translation verification, all national instruments were required to undergo layout verification by the TIMSS \& PIRLS International Study Center. Layout verification is the final external review and ratification of each participating country's assessment instruments, questionnaires, and corresponding documentation. During layout verification, staff at the TIMSS \& PIRLS International Study Center reviewed all national instruments to ensure international comparability of layout structure and proper documentation of any national adaptations.

In particular, layout verification focused on the following:

- Reviewing the national achievement materials and context questionnaires against the international versions for acceptable layout structure
- Reviewing national adaptations to the achievement materials and context questionnaires with respect to how they may influence the international comparability of the data
- Reviewing the online questionnaires against their corresponding paper versions (where applicable)
- Reviewing trend materials and bridge booklets against the previous national versions for consistency across cycles.

## Layout Verification of Achievement Materials

The primary goal of layout verification of achievement materials is to ensure that students in different countries experience the assessment instruments in the same way. Thus, the national versions of the paperTIMSS 2019 achievement booklets or eTIMSS item blocks were checked against the appropriate international versions to identify any deviations from the international format. For paperTIMSS instruments, layout verification was conducted on printed versions of each set of national booklets compared to printed versions of the international booklets. For eTIMSS materials, layout verification was conducted directly in the eTIMSS Online Translation System using the player preview mode. To accommodate on-screen verification, the translation system included a feature to view both the national preview and the international preview so that verifiers could compare each national item to the international version.

Due to differences in languages, the TIMSS national assessment instruments varied slightly in length and format across countries. The international versions, however, were designed with this in mind. For paperTIMSS materials, extra space was provided in the margins of the pages to facilitate the use of longer text and different paper sizes (letter versus A4) without necessitating extensive changes to the layout of each page. For eTIMSS, the layout of the items was designed to run vertically to minimize scrolling in longer languages. In addition, specific layout adjustments were made to national eTIMSS items, as needed, to accommodate things such as special characters, longer languages, and country-specific right to left requirements.

During layout verification of paperTIMSS instruments, verifiers reviewed the national booklets against the international versions with respect to pagination, page breaks, headers, footers, stop signs, item sequence, scoring boxes, response options, text formats, and graphics. For countries administering paperTIMSS in right-to-left languages this included ensuring that no elements were incorrectly altered in adjusting the alignment and conventions for graphics were implemented consistently throughout all booklets. Any layout deviations or errors, as well as any concerns of international incomparability of assessment items, were documented by the verifiers in the NAFs. Following layout verification, the NAFs containing the verifiers' comments were sent back to the National Research Coordinators for consideration. The NRC's were asked to confirm that each suggested change was implemented or provide an explanation for not implementing the suggested change.

During layout verification of eTIMSS materials, the verifiers reviewed the layout of all items, directions, system login pages, on-screen alerts, and eTIMSS system components including navigation tools, number pad, ruler, and calculator (8th grade only). The verifiers checked the eTIMSS materials for comparability to the international versions as well as on-screen readability, minimal scrolling, item sequence, response format, text format and graphics. For countries with right-to-left languages the verifiers checked that no elements were incorrectly altered in adjusting the alignment and conventions for graphics were implemented consistently throughout all of the items. As an additional step for eTIMSS layout verification, the verifiers also checked the basic functionality of the items and eTIMSS system components. Any technical issues were reported to the IEA Hamburg software unit to be fixed prior to development of the national Player software.

For eTIMSS, the verifiers entered their comments regarding layout deviations or errors, as well as any concerns of international incomparability directly in the eTIMSS Online Translation System. Comments from the verifiers included a reference to the text element, whether the comment was related to an adaptation or layout issue, and a button to "accept" or "reject" the comment. Following the completion of layout verification, the NRC's were asked to review the verifier's feedback and accept or reject each comment. If the NRC rejected a comment they were required to provide an explanation for not implementing the suggested change.

## Layout Verification of Context Questionnaires

As with the achievement booklets, the context questionnaires were checked against the international versions to identify any potential layout issues as well as to ensure the international comparability of the questionnaire data. During layout verification of questionnaires, the verifiers took into consideration any national adaptations documented by the NRCs. Instances of internationally incomparable adaptations or errors were recorded by the verifiers in the NAFs along with recommendations for recoding or rewording.

In an effort to make the questionnaires general enough for international analyses but appropriate for each intended audience, participating countries were required to adapt certain phrases and designations in the text of the questionnaires. For example, items asking about levels of education were expressed in terms of the current version of the International Standard Classification of Education ISCED 2011 (UNESCO Institute for Statistics, 2012), and required adaptation to the nationally equivalent educational terms by each participating country. These items were reviewed during layout verification in comparison to the ISCED level classifications, and if deemed internationally comparable, suggestions were made by the verifier to revise or recode their education categories.

The verifiers ensured that all items requiring adaptations were accompanied by proper English back translations. The documentation for these universally adapted questionnaire items was intended for later use in the National Adaptations Database. The database is a compilation of each country's questionnaire adaptations, to be used during data processing by IEA Hamburg (see Chapter 8). The information included in the database is reported as a supplement to the TIMSS 2019 User Guide for the International Database.

For countries that chose to administer the home, teacher, or school questionnaires online using the IEA Online SurveySystem (OSS), layout verification of the online questionnaires was conducted in the OSS environment. All countries that administered online questionnaires were also required to create paper directions containing information on accessing the online questionnaire and the purpose and use of the information being collected. The paper directions were reviewed by the layout verifiers in conjunction with the online questionnaires. For countries that administered any of the questionnaires in both paper and online, the layout verifiers compared the paper version to the corresponding online version to ensure consistency across the two forms. Feedback for both online and paper questionnaires were entered into the questionnaire NAFs and sent back to the NRCs for consideration. The NRCs were asked to confirm that each suggested change was implemented or provide an explanation for not implementing the suggested change.

## Layout Verification of Trend Materials and Bridge Booklets

For countries that previously participated in TIMSS 2015 or TIMSS 2011, the national TIMSS 2019 trend blocks were also reviewed against the versions from the last cycle in which the country participated. During layout verification of trend materials, the verifiers ensured that the layout structure and adaptations in the national TIMSS 2019 instruments were consistent with countries' trend versions. In the event a country needed to make a change to their trend materials due to an error in previous cycles or a change in curriculum, the TIMSS \& PIRLS International Study Center documented approval of the change or requested more information in the "trend check" section of the NAF.

For eTIMSS achievement materials, the change in mode of administration from paper to digital necessitated slight changes to the layout of some trend items. During layout verification the verifiers ensured that all conventions and adaptations in the eTIMSS 2019 materials were consistent with the trend versions and any changes beyond adjustments for digital administration were properly documented.

In addition to the eTIMSS 2019 achievement items, countries participating in eTIMSS also produced paper bridge booklets for use in the TIMSS 2019 bridge study. The bridge booklets were reviewed during layout verification alongside the corresponding national trend blocks from previous cycles. The verifiers also ensured that the pagination, page breaks, block sequence, headers, footers, graphics, covers, and directions of each bridge booklet matched the international versions of the TIMSS 2019 bridge booklets.

## Review of Final Instruments

Upon completion of layout verification, the NRCs were responsible for finalizing their national TIMSS 2019 instruments. This included making any necessary adjustments to the materials and responding to all the feedback from the layout verifiers. Once the materials were reviewed and finalized, NRCs were required to submit their materials to the TIMSS \& PIRLS International Study Center for a final review. In the final review of paper-based instruments (paperTIMSS, context questionnaires, and bridge booklets), the layout verifiers checked to see that all issues had been addressed, comments in the NAFs had been answered, and all of the compiled booklets and questionnaires had been submitted. Once, the TIMSS \& PIRLS International Study Center confirmed the materials were finalized, the country was permitted to begin printing the paper-based instruments. In the final review of eTIMSS achievement materials, the layout verifiers checked that all issues had been addressed in the eTIMSS Online Translation System, comments from verification had been answered, and all materials had been set to the status "Instrument Finalized." This status indicated that no further changes would be made to the materials and the country was now ready to receive their national Player software.

## Outcomes and Summary for TIMSS 2019

TIMSS 2019 followed stringent procedures for translation, adaptation, and verification. The ultimate goal of the translation and verification process was to create national versions of the TIMSS 2019 instruments that accommodated national languages and context while maintaining international comparability. The TIMSS \& PIRLS International Study Center provided countries and benchmarking entities with comprehensive guidelines and procedural manuals outlining the various steps of instrument preparation and verification.

The feedback from translation verification helped NRCs to improve the quality and comparability of their national instruments. Similarly, the feedback from the layout verification provided NRCs with explanations for the adjustments requested and helped ensure the international comparability of instruments across countries. Ultimately, the stringent procedures applied in TIMSS 2019 resulted in high quality instruments that allowed for comparisons in student achievement across all participating countries and benchmarking entities.

## CHAPTER 6

## Survey Operations Procedures for TIMSS 2019

## Overview

As data-based indicators of countries' student achievement profiles and learning contexts, TIMSS assessments are crucially dependent on the quality of the data collected by each participating country and benchmarking entity. Whereas the development of the assessments is an intensely collaborative process involving all of the partners in the enterprise, the process of administering the assessments and collecting the data is uniquely the responsibility of each individual country or benchmarking participant.

To ensure the consistency and uniformity of approach necessary for high-quality, internationally comparable data, all participants are expected to follow a set of standardized operations procedures. These procedures have been developed through a partnership involving the TIMSS \& PIRLS International Study Center, IEA Amsterdam, IEA Hamburg, Statistics Canada, and National Research Coordinators (NRCs) from participating countries. The major steps of the operations and procedures are similar from one assessment cycle to the next. However, with each assessment cycle the operations procedures are updated to enhance efficiency and accuracy and reduce burden, making use of developments in information technology to automate routine activities wherever possible.

Each new assessment cycle also brings something new and unique requiring the operations and procedures to be adapted. For example, the 2019 cycle of TIMSS began the transition to digital assessment (known as eTIMSS) with about half of the participating countries switching from the previous paperbased version (known as paperTIMSS) to the new digital format. Adapting operational procedures for this new assessment mode and integrating the workflow into the existing TIMSS operations was a significant undertaking. In order to control for any assessment mode effects, in addition to the usual nationally representative sample, countries transitioning to eTIMSS were required to administer "bridge" paper instruments to an extra, equivalent sample of students, which also required integrating operations and procedures into the overall TIMSS 2019 assessment administration.

In each country or benchmarking entity, the National Research Coordinator was responsible for the implementation of TIMSS 2019. Internationally, National Research Coordinators provided the country's perspective in all international discussions, represented the country at international meetings, and were the responsible contact persons for all project activities. Locally, National Research Coordinators were responsible for implementing all the internationally agreed-upon procedures and facilitating all of the national decisions regarding TIMSS, including any adaptations for the national context.

The daily tasks of the National Research Coordinators varied over the course of the TIMSS 2019 cycle. In the initial phases, National Research Coordinators participated in the TIMSS 2019 assessment frameworks and assessment development process (see Chapter 1). and collaborated with Statistics Canada and IEA Hamburg in developing a plan to implement the TIMSS 2019 sampling design within the country or benchmarking entity (see Chapter 3).

Following the development of the draft achievement items and context questionnaires, countries conducted a full-scale field test of all instruments and operational procedures in March through May 2018 in preparation for the TIMSS 2019 data collection, which took place in October through December 2018 in Southern Hemisphere countries, and in March through June 2019 in Northern Hemisphere countries. As well as providing crucial data to support finalization of the assessment instruments (achievement items and questionnaires), the field test enabled the National Research Coordinators and their staff to become acquainted with the operational activities. The feedback they provided was used to improve the procedures for the data collection. As expected, the field test resulted in some enhancements to survey operations procedures, especially for eTIMSS which was new for the 2019 assessment cycle and contributed to ensuring the successful execution of TIMSS 2019.

As part of ongoing efforts to improve operations, the National Research Coordinators were asked to complete a Survey Activities Questionnaire (SAQ), which sought feedback on all aspects of their experience conducting TIMSS 2019. The feedback solicited in the SAQ included an evaluation of the quality of the assessment materials and the effectiveness of the operations procedures and documentation. The results of the TIMSS 2019 Survey Activities Questionnaire are presented in the final section of this chapter.

## TIMSS 2019 Survey Operations Units, Manuals, and Software

To support the National Research Coordinators in conducting the TIMSS 2019 assessments, the TIMSS \& PIRLS International Study Center provided step-by-step documentation of all operational activities. Organized into a series of units, the TIMSS 2019 Survey Operations Procedures were made available at critical junctures of the project to ensure that National Research Coordinators had all the tools and information necessary to discharge their responsibilities. Also, the procedures units were accompanied by a series of manuals for use by School Coordinators and Test Administrators that National Research

Coordinators could translate and adapt to their local situations. Often, separate versions of the units and manuals were provided for paperTIMSS and for eTIMSS. The TIMSS \& PIRLS International Study Center and IEA Hamburg also provided National Research Coordinators and their staff with intensive training in constructed response item scoring and data management.

IEA Hamburg was responsible for the development of the eTIMSS software system, or "eAssessment System" (see Chapter 4). Hosted on IEA Hamburg's servers, the eAssessment System consisted of an integrated series of software modules for authoring achievement items (eTIMSS Item Designer), translating and verifying assessment instruments (eTIMSS Online Translation System), checking the suitability of computers for eTIMSS (eTIMSS System Check Program), administering the assessment to students (eTIMSS Player), monitoring the upload of student response and process data (eTIMSS Online Data Monitor), and scoring constructed response items (eTIMSS Online Scoring System, also known as IEA's CodingExpert Software).

In addition to the eAssessment System and consistent with the goal of automating and streamlining procedures wherever possible, IEA Hamburg provided National Research Coordinators in both eTIMSS and paperTIMSS countries with a range of custom-built software products to support project activities. These included the Windows ${ }^{\circledR}$ Within-School Sampling Software (WinW3S) for sampling and tracking classes and students; the IEA Online SurveySystem (OSS) for administering school, teacher, and home questionnaires online; the IEA CodingExpert Software for documenting scoring reliability; and the IEA Data Management Expert (DME) software for creating and checking data files.

The TIMSS 2019 Survey Operations Procedures units were crucial resources for the National Research Coordinators as the units described in detail the tasks the NRCs were responsible for conducting. In the event that some of these tasks were contracted out to other people or organizations, the units ensured that the NRCs had sufficient knowledge of these matters to supervise the activities of the people contracted to conduct aspects of the assessment in their countries.

The following units, manuals, and software systems were provided for administering TIMSS 2019:

- TIMSS 2019 Survey Operations Procedures Unit 1: Sampling Schools and Obtaining their Cooperation
- TIMSS 2019 Survey Operations Procedures Unit 2: Preparing for and Conducting the TIMSS 2019 Field Test

Unit 2 consisted of the following sections: Sampling Classes and Field Test Administration, Preparing the Field Test Instruments (paper or electronic), Scoring the Field Test Constructed Response Items, and Creating and Submitting the Field Test Databases. An eTIMSS supplement describing online scoring of the eTIMSS constructed response items also was included.

Unit 2 was accompanied by field test versions of the School Coordinator and Test Administrator Manuals for paperTIMSS and eTIMSS, instructions on "Preparing Computers and/or Tablets for eTIMSS," and a National Quality Control Monitor Manual.
In addition to the manuals, IEA Hamburg provided field test versions of the WinW3S withinschool sampling software, the OSS online survey system for questionnaire administration, and the DME data management software.
eTIMSS countries also were provided with field test versions of the following systems: eTIMSS System Check Program, eTIMSS Online Translation System, eTIMSS Player, eTIMSS Online Data Monitor, and eTIMSS Online Scoring System (IEA's CodingExpert Software).

- TIMSS 2019 Survey Operations Procedures Unit 3: Contacting Schools and Sampling Classes for the TIMSS 2019 Data Collection

Unit 3 was accompanied by the main data collection versions of the School Coordinator Manual and the WinW3S within-school sampling software and its manual. eTIMSS countries also received the eTIMSS System Check Program and instructions on "Preparing Computers and/or Tablets for eTIMSS," which provided the necessary information and tools for countries to test their devices for eTIMSS compatibility and prepare them for eTIMSS data collection.

- TIMSS 2019 Survey Operations Procedures Unit 4: Preparing the TIMSS 2019 Assessment Instruments

Separate versions of Unit 4 were provided for paperTIMSS and eTIMSS countries; the latter also received a manual on preparing the paper "bridge" booklets. The eTIMSS version provided access to the eTIMSS Online Translation System, which enabled National Research Coordinators to translate the eTIMSS achievement items into their language(s) of instruction. The translated materials were available online for translation and layout verification by IEA Hamburg and the TIMSS \& PIRLS International Study Center (see Chapter 5).
Unit 4 was accompanied by the main data collection version of the OSS online survey system for online administration of the school, teacher, and home (Early Learning Survey) questionnaires.

- TIMSS 2019 Survey Operations Procedures Unit 5: Conducting the TIMSS 2019 Data Collection

Unit 5 was accompanied by the main data collection versions of the Test Administrator Manuals for paperTIMSS and eTIMSS, the National Quality Control Monitor Manual, and the International Quality Control Monitor Manual.
eTIMSS countries also received the eTIMSS Player for administering the eTIMSS assessment to students and the eTIMSS Online Data Monitor for monitoring the uploading of the
data from the player to the IEA Hamburg data server. Each country's eTIMSS Player was customized to contain the country's translations of the eTIMSS assessment items.

- TIMSS 2019 Survey Operations Procedures Unit 6: Scoring the TIMSS 2019 Constructed Response Items

Unit 6 was accompanied by the main data collection versions of the TIMSS 2019 scoring guides and IEA's CodingExpert Software (online scoring system) and manuals. The CodingExpert Software was used to facilitate eTIMSS online scoring and the trend and crosscountry reliability scoring tasks.

- TIMSS 2019 Survey Operations Procedures Unit 7: Creating and Submitting the TIMSS 2019 Databases

Unit 7 was accompanied by the main data collection versions of the DME data management software, codebooks, and manual. The DME software is used for data entry and data verification.

## TIMSS 2019 Survey Tracking Forms

TIMSS uses a series of tracking forms to document class sampling procedures, assign assessment instruments, and track school, teacher, and student information, including the participation status of the respondents. The tracking forms also facilitate the data collection and data verification process. Four different tracking forms were used for TIMSS 2019:

- Class Listing Form: This form was completed by each sampled school, listing the eligible classes and providing details about the classes, such as the class stream (if applicable), the number of students, and the names of teachers.
- Student-Teacher Linkage Form: This form was completed for each class sampled, listing the names of the students and their teachers, student birth dates, gender, exclusion codes, and linking the students to their teachers.
- Student Tracking Form: This form was created for each class assessed and was completed by the Test Administrators during test administration. The Test Administrators used this form to verify the assignment of survey instruments to students and to indicate student participation.
- Teacher Tracking Form: This form was completed by each sampled school to indicate the completion of the Teacher Questionnaires.

## Operations for Data Collection

The following sections describe the major operational activities coordinated by the National Research Coordinators:

- Contacting schools and sampling classes
- Overseeing translation and preparing assessment instruments
- Managing the TIMSS 2019 assessment administration
- Scoring the constructed response items
- Creating the TIMSS 2019 data files

Two other major TIMSS 2019 operational activities are described in separate chapters of this publication-sampling schools (Chapter 3) and verifying translation and layout of the assessment instruments (Chapter 5).

## Contacting Schools and Sampling Classes

Exhibit 6.1 illustrates the major steps in working with schools to sample classes and prepare for the TIMSS assessment administration. Once the school samples were drawn, National Research Coordinators were tasked with contacting schools and encouraging them to take part in the assessments. Depending on the national context, this could involve obtaining support from national or regional educational authorities. Survey Operations Procedures Unit 1 included suggestions on ways to encourage schools to participate in the assessment.

Exhibit 6.1: Diagram of the Sampling Procedures and Preparations for the Assessment Administration Implemented by National Centers and Schools

## National Center

## Schools

## Contacting and Tracking Schools

- Contact sampled schools
- Get started in WinW3S (complete project information, import school sample database, translate/adapt tracking forms)
- Complete/adapt school information
- Record school participation
- Print Class Listing Forms and send them to School Coordinators for completion

List all fourth grade and/or eighth grade classes and their teachers on the Class Listing Form

## Class Sampling and Tracking;

Preparing Computers/Tablets for eTIMSS Administration

- Enter school and class information from Class Listing Forms into WinW3S
- Sample classes
- Enter teacher information from Class Listing Forms into WinW3S
- Print Student-Teacher Linkage Forms and send them to School Coordinators for completion
- If school computers/tablets are to be used for eTIMSS administration, send the "Preparing Computers and/or Tablets for eTIMSS" instructions and the eTIMSS System Check Program to School Coordinators

## Student and Teacher Tracking;

## Preparing Instruments for Assessment Administration

- If applicable, confirm with School Coordinators the method for delivering the eTIMSS Player to students
- Enter student information from Student-Teacher Linkage Forms into WinW3S
- Update teacher information and enter student-teacher linkage information from Student-Teacher Linkage Forms into WinW3S
- Assign achievement booklets / item block combinations to students
- Print tracking forms
- Print instrument labels
- Send tracking forms and labeled assessment materials to schools

List student information on the Student-Teacher Linkage Forms. If applicable, run the eTIMSS System Check Program on all available computers/tablets.

ASSESSMENT ADMINISTRATION

In cooperation with school principals, National Research Coordinators were responsible for identifying and training School Coordinators for all participating schools. A School Coordinator could be a teacher or guidance counselor in the school, or National Research Coordinators could appoint a member of the national center to fill this role. In some countries, a School Coordinator from the national center was responsible for several schools in an area. School Coordinators were provided with a School Coordinator Manual describing their responsibilities. The School Coordinator Manual was prepared by the TIMSS \& PIRLS International Study Center and translated/adapted by national center staff in each country.

The responsibilities of the School Coordinators included providing the national center with information on the school; coordinating the dates, times, and places for testing; identifying and training Test Administrators to administer the assessments; coordinating the completion of the tracking forms; distributing questionnaires; and when necessary obtaining parental permission. If school computers were used for eTIMSS administration, School Coordinators were provided with the "Preparing Computers and/ or Tablets for eTIMSS" instructions and the eTIMSS System Check Program in order to test the computers for eTIMSS compatibility and prepare the compatible computers for testing. School Coordinators also confirmed receipt of all assessment materials, oversaw the security of the assessment materials, and ensured the return of the assessment materials to the national center following assessment administration.

School Coordinators also played a critical role in providing information for the sampling process, providing the national center with data on eligible classes in the school. With this information, the national centers used the WinW3S within-school sampling software to sample class(es) within the school. WinW3S tracked school, teacher, and student information and generated the necessary tracking forms and instrument labels used to facilitate both the assessment administration process and data checking during the data cleaning process.

As TIMSS samples intact classes, one of the roles of the School Coordinator was to ensure that every student in the school was listed in one and only one class. This was necessary to ensure that the sample of classes resulted in a representative sample of students, and that every student at the target grade had a chance of being selected. At the fourth grade in most countries, students are taught mathematics and science in the same classroom and therefore the fourth grade classroom was designated as the sampling unit. At the eighth grade, however, students are grouped differently for mathematics and science instruction in many countries, so that a student may take mathematics with one group of students and science with a different group of students. As the sampling required one set of students who could be considered a classroom, eighth grade classrooms usually were defined on the basis of mathematics instruction for the purposes of sampling.

## Overseeing Translation and Preparing Assessment Instruments

National Research Coordinators also were responsible for preparing the assessment instruments (paperTIMSS achievement booklets, eTIMSS item block combinations, "bridge" booklets, if applicable, and context questionnaires) for their countries-a process that included overseeing the translation of the assessment instruments. The overarching goal of assessment instrument preparation was to create internationally comparable instruments that were appropriately adapted for the national context of each participating country.

As described in the TIMSS 2019 Assessment Design there were 14 blocks of assessment items for each subject and grade, and these were assembled into 14 TIMSS achievement booklets/item block combinations per grade, with two blocks of mathematics items and two blocks of science items in each booklet/block combination. eTIMSS had two additional block combinations per grade, incorporating the new Problem Solving and Inquiry Tasks (PSIs). Each block/PSI had to be translated only once, even though it was included in two different booklets/item block combinations. For paperTIMSS, countries used Adobe ${ }^{\oplus}$ InDesign ${ }^{\oplus}$ software to link the translated and adapted assessment blocks to the appropriate booklets. Automating this process through InDesign decreased the chances of human error in the production process.

In addition to the main eTIMSS assessment, countries transitioning to eTIMSS had to prepare eight "bridge" booklets for each grade, which were paper versions of eight eTIMSS item block combinations. The bridge booklets were composed entirely of the eight trend item blocks that were previously used in TIMSS 2015 and kept secure for TIMSS 2019. For the bridge booklets, countries also used InDesign software to link their translated and adapted assessment blocks from TIMSS 2015 to the appropriate bridge booklets.

In addition to the 16 trend blocks at each grade level from previous assessments (eight in mathematics and eight in science), twelve new assessment blocks were developed for TIMSS 2019 at each grade level (six mathematics and six science). The new assessment blocks replaced those released after the previous assessment cycle. Also, all four PSIs (two mathematics and two science) for each grade level were newly developed for eTIMSS 2019. Countries administering paperTIMSS 2019 at the fourth grade had the option of administering a less difficult mathematics assessment. The less difficult assessment consisted of nine item blocks previously administered in 2015 in TIMSS or TIMSS Numeracy and five blocks newly developed for TIMSS 2019.

All participating countries and benchmarking entities translated and/or adapted the item blocks into their language(s) of instruction. Countries that participated in the 2015 or 2011 assessment cycles were required to use the same translations that they used in those cycles for the trend assessment blocks.

Similarly, all context questionnaires (school, teacher, student, and, for fourth grade, home questionnaires) were translated/adapted and field tested by all participating countries and evaluated following the field test to gauge the validity and reliability of the various questionnaire scales.

In preparation for translation for both the field test and main data collection, the participating countries received the international version (English) of the achievement booklets/item block combinations and context questionnaires with all the necessary instrument production files, including fonts and graphics files. For the eTIMSS assessment, this was done via the eTIMSS Online Translation System. Instructions on how to use the materials to produce high-quality, standardized instruments were included in the corresponding Survey Operations Procedures units and manuals. IEA Amsterdam and the TIMSS \& PIRLS International Study Center also provided a generic Arabic source version of the TIMSS 2019 assessment booklets/item block combinations and context questionnaires. Individual countries adapted the generic source version to local usage.

Once translated and/or adapted, first for the field test and then again for the main data collection, the achievement items and context questionnaires were submitted to IEA Amsterdam for translation verification (see Chapter 5). IEA Amsterdam worked with independent translators to evaluate each country's translations and, when deemed necessary, suggested changes to the text.

After the translations had been verified by IEA Amsterdam, National Research Coordinators assembled the paper-based achievement booklets and context questionnaires using InDesign software, and print-ready copies of the instruments were sent to the TIMSS \& PIRLS International Study Center for layout verification and a review of national adaptations. For eTIMSS this also was achieved via the eTIMSS Online Translation System. This review checked that the instruments conformed to the international format and that any adaptations made to the instruments did not unduly influence their international comparability.

## Documenting National Adaptations

While preparing national achievement items and context questionnaires, countries sometimes by necessity made adaptations to the international versions. paperTIMSS countries documented all their national adaptations using the National Adaptations Forms (NAFs). eTIMSS countries documented their national adaptations to the achievement test via the eTIMSS Online Translation System and adaptations to the context questionnaires using the National Adaptations Forms.

Separate NAFs were provided for the paper achievement booklets and for the context questionnaires (per grade/assessment). During the translation verification and layout review, the verifiers checked whether the national adaptations were likely to influence the ability to produce internationally comparable data for the items involved. Any questions raised were directed to the NRC for consideration via the NAFs. Bridge booklets had their own Bridge Verification Forms, which were used to track any changes
to the national version of the 2015 cycle and to document any layout issues noted during the layout verification.

The documentation was completed and reviewed at various stages of preparing national assessment instruments. Version I of the forms and online documentation was completed during the internal translation and review process and sent along with the rest of the materials for international translation verification. After translation verification, the documentation (Version II) was updated in response to the translation verifier's comments, reflecting any changes resulting from the verification, and sent along with the national assessment instruments for layout and adaptations verification. Following layout verification, the national instruments and documentation were finalized (Version III) and submitted to IEA and the TIMSS \& PIRLS International Study Center.

## Managing the Administration of the TIMSS 2019 Assessments

Preparing and distributing assessment materials to the participating schools required careful organization and planning on the part of the National Research Coordinators. The assessment materials were packaged and sent to the School Coordinators prior to testing, giving ample time for the School Coordinators to confirm the receipt and correctness of the materials. The school and teacher questionnaires were then distributed, and the other instruments were kept in a secure room until the testing date.

Each sampled class was assigned a Test Administrator who followed procedures described in the Test Administrator Manual to administer the assessments and student questionnaire. Test Administrators were in most cases chosen and trained by School Coordinators, and in some cases, the School Coordinator doubled as the Test Administrator.

Test Administrators were responsible for distributing materials to the appropriate students, reading the instructions provided in the Test Administrator Manual to the students, and timing the sessions. WinW3S systematically assigned achievement booklets/eTIMSS item block combinations and produced labels to facilitate the distribution of the assessment, and Test Administrators used the Student Tracking Form and these labels to distribute the assessment instruments (devices for eTIMSS) to the correct students) and to document student participation. When a class had a participation rate below 90 percent, it was the School Coordinator's responsibility to hold a makeup session for the absent students before returning all of the testing materials to the national center. Using the Test Administration Form, the Test Administrators documented the timing of the testing sessions and information about anything out of the ordinary that took place during assessment administration.

The achievement booklets consisted of two sections and the time allotted for each section of the assessment was standardized and strictly enforced by the Test Administrator. The TIMSS assessment consisted of two parts with each containing two item blocks. To complete each part of the TIMSS achievement test, fourth grade students were allowed 36 minutes and eighth grade students were allowed 45 minutes. For eTIMSS countries, the eTIMSS Player automatically logged students out of the system
once the time allowed had expired. There was a required break between the two parts of assessment administration. The break was not to exceed 30 minutes. Students who completed part 1 or part 2 of the assessment before the allotted time were not allowed to leave the testing room and were asked to review their answers or read quietly. Some Test Administrators provided activity sheets for these students.

Following the administration of the TIMSS assessment, students were provided 30 minutes to complete the student questionnaire with extra time provided to students who needed it. Following the administration of the eTIMSS assessment, students also took a short computer-based questionnaire about their experiences and attitudes toward using a computer. During administration of the fourth grade student questionnaire, Test Administrators were permitted to read the questionnaire items aloud together with the students.
eTIMSS was mostly administered via individual USB sticks on individual eTIMSS compatible computers or via Android tablets. Sometimes, the server method was used via a Local Area Network (LAN), which entailed a single eTIMSS compatible computer being used as a local server and students using individual devices connected to the server computer. For eTIMSS, the Test Administrators and School Coordinators submitted/uploaded the eTIMSS data after each testing session. Due to computer shortages, sometimes multiple eTIMSS testing sessions were needed for each class.

## Linking Students to their Teachers and Classes

Exhibit 6.2 illustrates the hierarchical identification system codes that were used to link the data among schools, classes, students, and teachers. The school, class, and student IDs were strictly hierarchical, with classes nested within schools and students nested within classes.

Exhibit 6.2: Hierarchical Identification System Codes Used to Link Schools, Classes, Students, and Teachers

| Participant | ID Components | ID Structure | Numeric Example |
| :--- | :--- | :--- | :--- |
| School | School | CCCC | 0001 |
| Class | School + Class within the school | CCCCKK | 000101 |
| Student | School + Class within the school + <br> Student within the class | CCCCKKSS | 000102 |
| Teacher | School + Teacher within the school + <br> Linkage number to the sampled class | CCCCTTLL | 00010101 |

Each teacher was assigned a teacher identification number consisting of the four-digit school number followed by a two-digit teacher number. Since the same teacher could be teaching more than one class within a school, it was necessary to have a unique identification number for each teacher linked to a class. This is achieved by adding a two-digit link number to the six digits of the teacher identification number to create a unique eight-digit identification number.

## Online Administration of the School, Teacher, and Home Questionnaires

Countries could choose to administer the school, teacher, and home questionnaires online. The benefits of administering the questionnaires online included saving money and time in printing, and improving the efficiency of questionnaire distribution, data entry, and data cleaning.

For the online administration of the questionnaires, IEA Hamburg provided its IEA Online SurveySystem (OSS) Software that incorporates design, presentation, and monitoring components.

The design component, known as the Designer, supports the preparation of the online surveys, data management, and data output to IEA Hamburg. Through the OSS Designer, national centers could tailor the online questionnaires to their national language. To facilitate translation and adaptation, the Designer concurrently stored the original English question text and the translations and/or national adaptations. It also stored the variable names and data validation rules. If a national center decided not to administer a particular international question or option, it could be disabled in the Designer and not administered during the online questionnaire administration. The Designer also included an integrated preview function to allow for a visual side-by-side comparison of the paper/PDF and online versions of the questionnaires, facilitating the layout verification process.

For the online data collection, the OSS Web Component presented the questionnaires to the respondents. The navigation capabilities of the Web Component allowed respondents to pick and choose their order of response. Buttons marked "next" and "previous" facilitated navigation between adjacent pages, so users could browse through the questionnaire in the same way that they flip through the pages of the paper questionnaire. A hyperlinked interactive "table of contents" allowed the respondents to fluidly navigate to specific questions. Overall, these two functions permitted respondents to answer questions in the order of their choosing. Also, the online questionnaires could be accessed through any standard internet browser on all standard operating systems without any additional software.

Finally, the OSS Monitor component allowed NRCs to monitor the survey responses in real time. Many national centers made extensive use of the Monitor to follow-up with non-respondents.

IEA Hamburg followed a stringent set of procedures to safeguard the confidentiality of the respondents and maintain the integrity of the data. Each respondent received a statement of confidentiality, and information on how to access the online questionnaire. For most countries, the online questionnaire administration was hosted on the IEA Hamburg customized high performance server. This server allowed for the 24 -hour availability of the questionnaires during the data collection period, and it also ensured backup and recovery provisions for the data.

## Scoring the Constructed Response Items

Constructed response items represent a substantial portion of the TIMSS assessments, and because reliable and valid scoring of these items is critical to the assessment results, the TIMSS \& PIRLS International Study Center provided explicit scoring guides for each individual item and extensive training in their use. Also, the Survey Operations Procedures units specified a procedure for efficiently organizing and implementing the scoring activity. Scoring the eTIMSS constructed response items was done online via IEA's CodingExpert Software, which incorporated the IEA standards and reliability procedures.

International scoring training sessions (one for the field test and two for the main data collectionone for Southern Hemisphere countries and another for Northern Hemisphere countries) were conducted where all National Research Coordinators (or country representatives appointed by the National Research Coordinators) were trained to score each of the constructed response items. At these training sessions, the scoring guide for each item was reviewed and applied to a set of example student responses that had already been scored. These example papers were chosen to represent a range of response types and to demonstrate the guides as clearly as possible. Following the example papers, the training participants applied the scoring guides to a different set of student responses that had not yet been scored. The scores to these practice papers were then shared with the group and any discrepancies were discussed.

Following international scoring training, national centers trained their scoring staff on how to apply the scoring guides for the constructed response items. National Research Coordinators were encouraged to create additional example papers and practice papers from student responses collected in their country.

## Documenting Scoring Reliability

Because reliable scoring of the constructed response items is essential for high quality data, it is important to document the reliability of the scoring process. A high degree of scorer agreement is evidence that scorers have applied the scoring guides in the same way. The procedure for scoring the TIMSS constructed response items provided for documenting scoring reliability within each country (within-country reliability scoring), over time (trend reliability scoring), and across countries (cross-country reliability scoring) (see results in Chapter 10).

The method for establishing the reliability of the scoring within each country was for two independent scorers to score a random sample of 200 responses for each constructed response item. The degree of agreement between the scores assigned by the two scorers is a measure of the reliability of the scoring process. In collecting the within-country reliability data, it was vital that the scorers independently scored the items assigned to them, and each scorer did not have prior knowledge of the scores assigned by the other scorer. The within-country reliability scoring was integrated within the main scoring procedure and ongoing throughout the scoring process.

The purpose of the trend reliability scoring was to measure the reliability of the scoring from one assessment cycle to the next (i.e., from TIMSS 2015 to TIMSS 2019). The trend reliability scoring
required scorers of TIMSS 2019 to score student responses collected in 2015. The scores from 2019 were then compared with the scores awarded in 2015. Trend reliability scoring was conducted using IEA's CodingExpert Software provided by IEA Hamburg.

Student responses included in the trend reliability scoring (200 responses per item) were actual student responses to 22 fourth grade items ( 13 items for the less difficult mathematics assessment) and/ or 27 eighth grade items ( 4 item blocks) from the TIMSS trend assessment blocks collected during the TIMSS 2015 assessment administration in each country and benchmarking entity. These responses were scanned and provided to each participating country and benchmarking entity, and were scored with IEA's CodingExpert Software. All scorers who scored the trend assessment blocks in 2019 were required to participate in the trend reliability scoring. If all scorers were trained to score all trend items, the software divided the student responses equally among the scorers. If scorers were trained to score specific assessment blocks, National Research Coordinators were able to specify within the software which scorers would score particular blocks, and the software allocated the student responses accordingly. Similar to the within-country reliability scoring, the trend reliability scoring had to be integrated within the main scoring procedure.

Finally, cross-country reliability scoring gave an indication about how consistently the scoring guides were applied from one country to the next. The cross-country reliability scoring also was conducted using IEA's CodingExpert Software. Student responses included in the cross-country reliability scoring (200 responses per item) were student responses to 22 fourth grade items ( 17 items for the less difficult mathematics assessment) and/or 27 eighth grade items. The same items were used for the trend scoring reliability study. Student responses were collected from the English-speaking countries during the TIMSS 2015 assessment administration. All scorers who could score student responses written in English were required to participate in the cross-country reliability scoring, and the student responses were equally divided among the participating scorers in each country. In most countries, the scoring exercise was completed immediately after all other scoring activities.

## Creating the TIMSS 2019 Databases

The data entry process took place from March to May 2018 for the field test, from December 2018 to March 2019 following data collection in the Southern Hemisphere, and June to September 2019 following data collection in the Northern Hemisphere. The procedure for creating the TIMSS 2019 databases included entering sampling and assessment administration information into WinW3S and adding responses from the context questionnaires and achievement booklets using IEA's Data Management Expert (DME) software. IEA Hamburg provided the DME software to accommodate keyboard data entry from the paper instruments. The DME software also offers data and file management capabilities, a convenient checking and editing mechanism, interactive error detection, and quality control procedures.

The eTIMSS achievement test data were captured automatically by submitting them to the IEA Hamburg eTIMSS server immediately after the assessment administration. Countries were provided with the eTIMSS Online Data Monitor to monitor the data submission. The eTIMSS constructed response scoring took place directly in the online database and thus did not require any manual data entry. For the TIMSS 2019 teacher, school, and home questionnaires administered online through the Online SurveySystem (OSS) via the IEA Hamburg server, the data were directly accessible by IEA Hamburg and no further data entry was required.

For manual data entry using the DME software, IEA Hamburg provided international codebooks describing all variables and their properties to ensure that data files produced with this system met the internationally defined rules and standards for data entry. Before being used, however, the international codebooks had to be updated to accommodate any national adaptations to the data collection instruments. These adapted national codebooks then were used to create the TIMSS 2019 data files in each country, with the responses to the context questionnaires, achievement booklets, and Reliability Scoring Sheets keyed into the DME database.

Quality control throughout the data entry process was essential to maintain accurate data. Therefore, National Research Coordinators were responsible for performing periodic reliability checks during data entry and for applying a series of data verification checks provided by both WinW3S and DME systems prior to submitting the databases to IEA Hamburg. To ensure the reliability of the data entry process, data entry staff was required to independently reenter at least 5 percent of the records from each instrument type. An error rate of 1 percent or less was acceptable for the questionnaire files. An error rate of 0.1 percent or less was required for the student achievement files and the reliability scoring files. If the required agreement was not reached, retraining of the key punchers was required.

Both WinW3S and DME systems offered a data verification module that checked for a range of problems, such as inconsistent identification codes, inconsistencies between participation status information and achievement and/or questionnaire data availability, and out-of-range or otherwise invalid codes. The data verification module also verified the integrity of the linkage between the students, teachers, and schools entered into the DME database and tracking of information for those specified in WinW3S. For data captured online (i.e., eTIMSS achievement data and context questionnaires administered online), it was possible to export data availability information and apply data verification to check for inconsistencies via the WinW3S and DME data verification modules.

When all data files had passed the quality control checks, they were submitted to IEA Hamburg, along with data documentation, for further checking and processing. For information on data processing at IEA Hamburg, please refer to Chapter 8 of this publication.

## TIMSS 2019 Survey Activities Questionnaire

The Survey Activities Questionnaire was designed to elicit information about National Research Coordinators' experiences in preparing for and conducting the TIMSS 2019 data collection. The questionnaire was composed of six sections and focused on the following:

- Sampling schools and classes
- Translating, adapting, and producing the assessment instruments
- Administering the assessments
- Implementing the National Quality Control Program
- Preparing for and scoring the constructed response items
- Creating and submitting the databases and documentation

All items in the Survey Activities Questionnaire included accompanying comment fields, in which NRC respondents were encouraged to explain their responses, provide additional information, and suggest improvements for the process.

The TIMSS 2019 Survey Activities Questionnaire was administered online via the OSS system and was completed by a total of 65 NRCs, 31 for paperTIMSS and 34 for eTIMSS. The following sections summarize information gathered from the Survey Activities Questionnaire.

## Sampling Schools and Classes

The first section of the Survey Activities Questionnaire asked National Research Coordinators about the Survey Operations Procedures units for sampling both schools and classes within the sampled schools. As shown in Exhibit 6.3, 59 National Research Coordinators considered Survey Operations Procedures Unit 1 to be clear and sufficient, and 63 considered Unit 3 to be clear and sufficient. Eight countries reported deviating from the basic TIMSS sampling design. Their reasons for these modifications to the sampling procedures included a change in the way a country identified schools, adjustments for classes based on gender, special needs, or mixed grade levels, identification of schools for the field test and the main data collection at separate times, and the need to oversample for enhanced reporting. Statistics Canada, in cooperation with IEA Hamburg, selected the school samples for all countries and benchmarking participants.

Exhibit 6.3: Survey Activities Questionnaire, Section One—Sampling (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :--- | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2019 Survey <br> Operations Procedures Unit 1: Sampling Schools and <br> Obtaining their Cooperation" clear and sufficient? | 59 | 5 |  |
| Were there any conditions or organizational constraints that <br> necessitated deviations from the basic TIMSS sampling <br> design described in the "Survey Operations Procedures | 8 | 56 | 1 |
| Unit 1"? | 63 | 0 | 1 |
| Did you use the Within-School Sampling Software (WinW3S) <br> to sample classes? | 63 | 2 |  |
| If you answered "yes", did you experience any problems <br> when using the WinW3S software? | 17 | 45 | 3 |
| Was the information provided in the "TIMSS 2019 Survey <br> Operations Procedures Unit 3: Contacting Schools and <br> Sampling Classes" clear and sufficient? | 63 | 1 | 1 |
| Did you follow the procedures outlined in "TIMSS 2019 <br> Survey Operations Procedures Unit 3: Contacting Schools <br> and Sampling Classes" for working with the schools to <br> sample classes (e.g., using the appropriate tracking forms <br> in the proposed order to obtain information from School <br> Coordinators)? | 53 | 10 | 2 |

Almost all of the National Research Coordinators reported using the Windows ${ }^{\circledR}$ Within-School Sampling Software (WinW3S) provided by IEA Hamburg to select classes within the sampled schools. National Research Coordinators reported experiencing problems using the WinW3S software. Among the issues reported were the slow processing speed, difficulty in accepting 2019 dates, and difficulties created by the status of excluded students.

Ten National Research Coordinators applied some modifications to the procedures outlined in the Survey Operations Procedures Unit 3. For example, some National Research Coordinators used an online survey or online form to gather information from School Coordinators. Some National Research Coordinators did not use the Class Listing Forms because a class-level database was available from the ministry or national center, and one country did not use the Teacher Tracking Forms because there was only one teacher per class in every school. All modifications were reviewed and approved by the TIMSS \& PIRLS International Study Center.

## Translating, Adapting, and Producing Assessment Instruments

The second section of the Survey Activities Questionnaire asked National Research Coordinators about translating, adapting, assembling, and printing the test materials, as well as issues related to checking the materials and securely storing them. Some eTIMSS-specific questions were asked in this section related
to using the eTIMSS Online Translation System, receiving the eTIMSS Player, and preparing USBs in order to deliver eTIMSS to schools and students.

As reported in Exhibit 6.4, almost all National Research Coordinators found the instructions on preparing achievement booklets, context questionnaires, and eTIMSS item block combinations to be clear and sufficient. However, ten countries reported experiencing some problems using the paper-based survey instrument production materials. These problems mostly included issues with fonts and special characters (e.g., for Cyrillic alphabet) and difficulties due to changes in staff between the field test and main data collection. The 13 National Research Coordinators who reported issues with the eTIMSS Online Translation System noted the difficulty in editing the format of some text and images, in adjusting for font-related issues, particularly regarding character-based languages, and in using some shared text across grades. All of the identified problems were resolved either by specialists at the national center or with assistance from IEA Hamburg and the TIMSS \& PIRLS International Study Center.

All but three National Research Coordinators reported applying corrections to their survey instruments as suggested by the external translation verifier or the layout verifier. When suggestions were rejected it was because the language suggested was not the most appropriate for the age group or was not consistent with styles used in trend items, because of the National Research Coordinator's strong preference, or due to time constraints.

Exhibit 6.4: Survey Activities Questionnaire, Section Two-Translating, Adapting, and Producing Assessment Instruments (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2019 Survey Operations Procedures Unit 4: Preparing the Assessment Instruments" clear and sufficient? | 61 | 2 | 2 |
| Did you encounter any major problems using the assessment instrument InDesign/RTF production/translation materials (used for preparing the paper context questionnaires and achievement booklets)? | 10 | 53 | 2 |
| Did you encounter any major problems using the eTIMSS Translation System for preparing the eTIMSS achievement test? | 13 | 20 | 1 |
| After the translation verification (IEA Amsterdam), did you correct your translations/adaptations as suggested by the verifier in the majority of cases? |  |  |  |
| paperTIMSS achievement booklets | 29 | 0 | 2 (Not Answered) 34 (Not Applicable) |
| eTIMSS bridge booklets | 31 | 0 | 3 (Not Answered) <br> 31 (Not Applicable) |

Exhibit 6.4: Survey Activities Questionnaire, Section Two-Translating, Adapting, and Producing Assessment Instruments (Numbers of NRC Responses) (continued)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Context questionnaires | 61 | 0 | 1 (Not Answered) <br> 3 (Not Applicable) |
| eTIMSS achievement test | 30 | 2 | 2 (Not Answered) <br> 31 (Not Applicable) |
| After the layout verification (TIMSS \& PIRLS International Study Center), did you correct your assessment instruments as noted by the verifier in the majority of cases? |  |  |  |
| paperTIMSS achievement booklets | 29 | 0 | 2 (Not Answered) 34 (Not Applicable) |
| eTIMSS bridge booklets | 30 | 1 | 3 (Not Answered) <br> 31 (Not Applicable) |
| Context questionnaires | 60 | 0 | 1 (Not Answered) <br> 3 (Not Applicable) |
| eTIMSS achievement test | 31 | 1 | 2 (Not Answered) <br> 31 (Not Applicable) |
| Did you apply any quality control measures to check paper assessment instruments during the printing process (e.g., checking for missing pages, upside down pages, text too bright or too dark)? | 58 | 4 | 3 |
| Did you experience any problems receiving the eTIMSS Player(s) from IEA Hamburg and preparing the eTIMSS USB sticks and/or tablets? | 2 | 31 | 1 |
| Did you apply quality control measures to check random eTIMSS USBs (e.g., number of files, size of the files, initiating the eTIMSS Player) before they were provided to schools? | 26 | 1 | 7 |
| Did you take measures to protect the security of the assessment instruments during the preparing and duplicating process? | 61 | 3 | 1 |
| Did you detect any potential breaches in security of the assessment instruments? | 0 | 64 | 1 |
| Did you encounter any problems preparing the Online SurveySystem files for administering the school, teacher, and/or home (Early Learning Survey) questionnaires online? | 6 | 23 | 1 (Not Answered) 35 (Not Applicable) |

Nearly all of the countries conducted the recommended quality control checks during the process of printing the testing materials for paperTIMSS and preparing devices for eTIMSS. Samples of the printed material were checked for any missing pages, pages in the wrong order, upside down pages, and text being too dark or too light. For eTIMSS, countries randomly sampled USB sticks/tablets to ensure the size of the files and/or that they were operating properly.

Six countries reported that they experienced problems with the IEA's Online SurveySystem (OSS). They reported issues with adding national questions and adding skip-logic to some questions. These problems were solved with assistance and support from IEA Hamburg.

## Assessment Administration

The third section of the Survey Activities Questionnaire addressed the extent to which National Research Coordinators were notified about errors in the testing materials sent to schools. As shown in Exhibit 6.5, a small number of errors were found in the materials. Almost half of such errors were corrected before distributing the materials to the respondents. Errors found after distribution were mostly minor, and were either fixed by School Coordinators or replacement materials were provided. The cases where the errors could not be remedied were reported to the TIMSS \& PIRLS International Study Center, where decisions were made about setting the problematic data to "not administered."

Exhibit 6.5: Survey Activities Questionnaire, Section Three-Assessment Administration (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2019 Survey Operations Procedures Unit 5: Conducting the Data Collection" clear and sufficient? | 62 | 2 | 1 |
| Were any errors detected in any of the following assessment materials after they were sent to schools? |  |  |  |
| paperTIMSS achievement booklets | 9 | 21 | 1 (Not Answered) 34 (Not Applicable) |
| paperTIMSS achievement booklet ID labels | 4 | 26 | 1 (Not Answered) 34 (Not Applicable) |

| Outsourced company | 3 | - | - |
| National center | 6 | - | - |
| A combination of above | 15 | - | - |

If you used personal computers, did you use the individual USB sticks or the local server method to administer eTIMSS in your country?

| Individual computers/USB sticks | 16 | - | - |
| :--- | ---: | :--- | :--- |
| Local server method | 3 | - | - |
| Both methods were used | 10 | - | - |
| Not applicable, only tablets were used <br> Did you require/suggest/provide an additional person to help <br> the Test Administrators during the eTIMSS testing sessions? | 26 | - | 1 |
| Did you experience any software-specific problems with the <br> eTIMSS Player(s)? | 16 | 17 | 1 |
| Did you have a sufficient number of computers/tablets <br> available for all/most schools to test all of the selected | 22 | 11 | 1 | students (the whole class) at the same time?

In May 2018, a new General Data Protection Regulation (GDPR) was implemented in the European Union law on data protection and privacy for all individuals within the European Union and the European Economic Area. In order for the TIMSS study to comply with the requirements of the law, IEA provided countries with templates of the Data Protection Declaration for each of the TIMSS 2019 context questionnaires, specifically reflecting the content of each questionnaire. The provided templates were fully compliant with the GDPR of Europe. All European countries prepared a Data Protection Declaration, complying with the GDPR and country-specific amendments to the law, and provided it along with each of the TIMSS 2019 national context questionnaires. Some non-European participating countries also adapted and adopted the declaration as required by law in those countries. Altogether 30 National Research Coordinators responded that they prepared and provided Data Protection Declaration along with national context questionnaires.

Six National Research Coordinators reported difficulties translating the School Coordinator Manual and/or the Test Administrator Manual. Primarily, problems arose when the manual(s) had to be reorganized or adapted and the standardized procedures were modified (e.g., no Class Listing Forms or Teacher Tracking Forms were used). Countries administering both eTIMSS and bridge booklets also had two sets of manuals to prepare.

In 56 countries, School Coordinators were appointed from within the participating schools. In the remaining countries, School Coordinators were from the national center or were contracted externally. In most countries, the National Research Coordinators organized centralized training sessions for School Coordinators. In others, training was conducted through webinars, regional meetings, and online and written materials. In 37 countries, Test Administrators were trained by the School Coordinators within the participating schools. In the remaining countries, Test Administrators were trained by members of the national center staff.

Although the TIMSS administration mostly went well, Test Administrators occasionally reported difficulties. Among the problems documented by Test Administrators were the following: loud noises outside the classroom, some disruptive students, some students being unfamiliar with some of the subject material, some students having difficulty with the language of the test, some technical problems with eTIMSS administration, the length of the student questionnaire in some countries, and some commenting that the test was too long or that there was not enough time to complete it.

Less than half the countries that administered the school, teacher, and/or home questionnaires online reported issues. The great majority of these issues related to typos or user error when typing in the URL or login information. For some countries, the problem was easily solved by providing direct links to the correct web address.

In most countries administering eTIMSS, an additional person helped the Test Administrators during the eTIMSS testing sessions. This was usually the classroom teacher, School Coordinator, or an information technology consultant/expert. Several countries added two people per classroom to help with computer set up as well as any technical issues that arose during the testing session.

In about half the eTIMSS countries, some software-specific problems occurred. In the early sessions, there were some issues with initiating the software that were promptly addressed by IEA Hamburg. Other problems included the system sometimes crashing during testing, timer disabling for special needs students not working properly, inability to close the program, difficulty in using the ruler, unintentionally moving out of the test on tablet touchscreens, and some issues with submitting the data. In all but a few cases, eTIMSS was successfully administered despite the need to resolve the above reported issues.

Twenty-two of the 34 countries administering eTIMSS had enough computers or tablets to test all the selected classes at the same time. The rest of the schools held multiple sessions, from two to nine sessions per school. Two countries reported providing extra computers to schools specifically for the testing sessions.

## National Quality Control Program

The fourth section of the Survey Activities Questionnaire addressed the National Quality Control Program that each country implemented during data collection (see Chapter 7). As part of national quality assurance activities, National Research Coordinators were instructed to send National Quality Control Observers to ten percent of the participating schools to observe both TIMSS and eTIMSS test administration and to document compliance with the prescribed procedures. The national program was in addition to the program of International Quality Control visits conducted by IEA. Some countries did not use national monitors due to the additional cost or planning time needed for the program. Others made additional efforts when training Test Administrators or used phone calls, surveys and National Resource Center staff to gather information.

As shown in Exhibit 6.6, when applicable, almost all of the national centers conducted their quality assurance program using the National Quality Control Monitor Manual provided by the TIMSS \& PIRLS International Study Center. Among the documented problems detected by the national monitors were eTIMSS technical issues where students needed to change computers during the test, schools saying the fourth grade assessment was too long for students, a high absentee rate due to flu season, and in one country, issues with poor testing facilities.

## Exhibit 6.6: Survey Activities Questionnaire, Section Four—National Quality Control Program (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :--- | :---: | :---: | :---: | :---: |
| Did you conduct a national quality control program that <br> observed the data collection in the participating schools? | 56 | 8 | 1 |
| Did you use the National Quality Control Monitor (NQCM) <br> Manual and the Classroom Observation Record provided by <br> the TMSS \& PIRLS International Study Center to conduct <br> your national quality control program? | 51 | 6 | 8 (Not Applicable) |
| Did your national quality control monitors (NQCMs) <br> document any major problems or special circumstances that <br> occurred frequently during the assessment administration? | 9 | 48 | 8 |

## Preparing for and Scoring the Constructed Response Items

Exhibit 6.7 provides data on responses to items asking National Research Coordinators about their experiences preparing for and scoring the constructed response items. Almost all National Research Coordinators found the scoring procedures as explained in the Survey Operations Procedures Unit 6: Scoring the Constructed Response Items to be clear and sufficient. Countries reporting problems with the scoring training materials asked for more "borderline" examples, including more detailed explanations
within the scoring guides. Almost half of National Research Coordinators reported creating their own national examples and practice papers for training their scorers, as suggested by the TIMSS \& PIRLS International Study Center.

Exhibit 6.7: Survey Activities Questionnaire, Section Five—Preparing for and Scoring the Constructed Response Items (Numbers of NRC Responses)

| Question | Yes | No | Not Answered |
| :---: | :---: | :---: | :---: |
| Was the information provided in the "TIMSS 2019 Survey Operations Procedures Unit 6: Scoring the Constructed Response Items" clear and sufficient? | 60 | 3 | 2 |
| Did you encounter any major problems using the scoring training materials, provided by the TIMSS \& PIRLS International Study Center? | 8 | 55 | 2 |
| Did you create national scoring training materials in addition to the international scoring training materials? | 31 | 32 | 2 |
| Did you scan any paper achievement booklets for electronic image scoring? | 3 | 27 | 1 (Not Answered) <br> 34 (Not Applicable) |
| Did you encounter any major procedural problems during the TIMSS 2019 constructed response item scoring in your country? | 2 | 61 | 1 (Not Answered) <br> 1 (Not Applicable) |
| Did you encounter any major problems with the Online Scoring System (IEA's CodingExpert Software)? | 12 | 51 | 2 (Not Answered) <br> 0 (Not Applicable) |
| Did all your scorers participate in scoring student responses of the trend items, including the Trend Reliability Scoring? | 36 | 18 | 1 (Not Answered) 10 (Not Applicable) |
| Did all your scorers participate in the Cross-country Reliability Scoring? | 26 | 34 | 5 (Not Answered) <br> 0 (Not Applicable) |

Three countries scanned their TIMSS achievement booklets and scored student responses electronically. A small number of countries reported some minor problems using the Online Scoring System (IEA's CodingExpert Software), which was used for all eTIMSS scoring and also for the trend and cross-country reliability scoring for both paper and eTIMSS countries. The reported problems included software-related issues that were addressed early in the process by IEA Hamburg, difficulty assigning items to scorers, and problems with scanned images.

Because English was used for the cross-country reliability scoring task, not all scorers were able to participate. Only one country reported no participation, while the majority reported at least two or more scorers participating. For the countries that did not participate in the previous cycle of TIMSS, the question on the trend reliability scoring procedures did not apply.

## Creating and Submitting the Databases and Documentation

The last section of the Survey Activities Questionnaire addressed data entry of the paper assessment instruments, administration data entry, and data quality control activities. As shown in Exhibit 6.8, almost all of the National Research Coordinators found the instructions in Survey Operations Procedures Unit 7: Creating and Submitting the TIMSS 2019 Databases to be clear and sufficient. Some National Research Coordinators reported issues when using WinW3S, mainly related to import and export functions. For example, the participation status of excluded students created an issue when importing data, and time/ date data needed to be entered manually by some countries. IEA Hamburg was able to provide support to countries as needed.

| :--- |

In 26 countries, the national center staff entered data from the paper instruments and 22 countries used a combination of national center staff, temporarily hired staff, and an external data entry firm. Some countries used optical scanning instead of manual data entry. All countries but one reported applying all required data quality checks. All countries reported having securely stored their original assessment instruments until all data are processed and reported, and these materials can be destroyed. The nonresponses here correspond to the benchmarking participants for whom data entry and instrument storage was done centrally for the whole country.

## CHAPTER 7

## International Quality Assurance Program for TIMSS 2019

Standardized assessment materials and survey operations procedures were developed and adapted from previous cycles so that the TIMSS 2019 data collection met the highest standards. To document data collection activities and verify that the standardized procedures were followed, the TIMSS \& PIRLS International Study Center, working with IEA Amsterdam, developed and implemented an International Quality Assurance Program, whereby International Quality Control Monitors visited a sample of schools in each country and observed the TIMSS 2019 assessment administration. The purpose of this chapter is to provide an overview of the International Quality Assurance Program and report on the data collected through this program.

## Overview

The International Quality Assurance Program was implemented by independent International Quality Control Monitors (IQCMs) appointed by IEA Amsterdam. The major task of the IQCMs was to conduct site visits during the data collection process. In each country, the IQCM visited a sample of 15 participating schools at each grade during the assessment administration. When there were one or more benchmarking participants from the same country and only one centrally organized national center responsible for all aspects of data collection, the IQCM visited five additional schools in each benchmarking entity in addition to the schools visited for the country as a whole. In countries transitioning to eTIMSS during the 2019 assessment cycle, three additional schools per grade were visited for the paper "bridge" booklet administration.

In each school visited, IQCMs observed the testing sessions and recorded their observations, noting any deviations from the standardized administration script, timing, and procedures. They also interviewed the School Coordinators about their experiences coordinating the assessment. For paperTIMSS, the ICQMs verified that the suggestions made by the international translation and layout verifiers had
been integrated into the final national versions of both the paper achievement booklets and context questionnaires, as documented in the National Adaptation Forms. This was not necessary for digital instruments as the eTIMSS Translation System was able to track all translation and layout verification comments and subsequent changes.

Prior to beginning their assignments, the IQCMs attended a mandatory training session conducted by the TIMSS \& PIRLS International Study Center. There were two training sessions, one for Southern Hemisphere countries (September 2018) and one for Northern Hemisphere countries (January 2019). During the training, IQCMs were introduced to the TIMSS 2019 Survey Operations Procedures, the assessment design, and context questionnaires. IQCMs were also supplied with a manual detailing their role and responsibilities as well as the necessary materials for completing the quality control tasks.

An important aspect of the International Quality Assurance Program is the independence of the IQCMs from the national centers. In most participating countries and benchmarking entities, IEA Amsterdam recruited IQCMs who had served in the same role in previous IEA assessments. For the remaining countries, National Research Coordinators assisted IEA Amsterdam in nominating an International Quality Control Monitor. The nominated person could not be a member of the national center, a family member, or personal friend of the National Research Coordinator. Often, this person was a school inspector, ministry official, or retired schoolteacher. The IQCM was required to be fluent in both English and the language(s) spoken in the country.

When necessary, the IQCMs were permitted to recruit assistants to effectively cover the territory and testing timetable. For TIMSS 2019, a total of 71 IQCMs were trained across the 64 participating countries and 6 benchmarking participants. In addition, the IQCMs trained more than 200 assistant monitors.

International Quality Control Monitors observed 493 paperTIMSS (including bridge booklet administration) fourth grade testing sessions, 471 eTIMSS fourth grade testing sessions, 322 paperTIMSS (including bridge booklet administration) eighth grade testing sessions, and 383 eTIMSS eighth grade testing sessions. Altogether, IQCMs observed 1,669 testing sessions for TIMSS 2019. The results of the TIMSS 2019 IQCM observations are reported in the following sections of this chapter.

## Quality Control Observations of the TIMSS 2019 Data Collection

International Quality Control Monitors (IQCMs) conducted site visits during the assessment administration to a sample of schools in each country. For each school visit, the IQCMs completed the Classroom Observation Record. The records were completed online via the IEA's Online SurveySystem.

The observation records were organized into the following sections:

- Section A-Documentation of the TIMSS Testing Session
- Section B-Summary Observations of the TIMSS Testing Session
- Section C-Student Questionnaire Administration and Distribution of the Early Learning Survey
- Section D-Interview with the School Coordinator

## Documentation and Summary Observations of the TIMSS 2019 Testing Sessions

Sections A and B of the Classroom Observation Record addressed activities that took place during the testing sessions. The assessments were administered in two parts with a break of up to 30 minutes between each part. During test administration, IQCMs were asked to observe the activities of the Test Administrator, such as distributing, collecting, and securing the testing materials, following the assessment administration script, and timing the testing sessions.

The percentages of IQCM responses on these activities are reported in Exhibit 7.1 for paperTIMSS fourth grade testing sessions, Exhibit 7.2 for eTIMSS fourth grade, Exhibit 7.3 for paperTIMSS eighth grade, and Exhibit 7.4 for eTIMSS eighth grade. IQCMs reported that the assessments were conducted in accordance with the international procedures.

## Exhibit 7.1: Observations of paperTIMSS 2019 Fourth Grade Administration Sessions 493 Observations (Percentage of IQCM Responses)

| Question | Yes <br> (\%) | No <br> (\%) | Not Answered or Not Applicable (\%) |
| :---: | :---: | :---: | :---: |
| Did the Test Administrator distribute test booklets according to the booklet assignment on the Student Tracking Form and booklet labels? | 98 | 2 | 0 |
| Was the total testing time for Part 1 of the testing session equal to the time allowed? | 95 | 5 | 0 |
| Did the Test Administrator announce, "You have 10 minutes left" prior to the end of Part 1 of the testing session? | 93 | 7 | 0 |
| Were there any other "time remaining" announcements made during Part 1 of the testing session? | 29 | 71 | 0 |
| Was the total time for the break between Part 1 and Part 2 of the testing session equal to or less than 30 minutes? | 97 | 3 | 0 |
| Were the booklets left unattended or unsecured during the break? | 4 | 96 | 0 |
| Was the total testing time for Part 2 of the testing session equal to the time allowed? | 94 | 6 | 0 |
| Did the Test Administrator announce "you have 10 minutes left" prior to the end of Part 2 of the testing session? | 91 | 9 | 0 |
| Were there any other "time remaining" announcements made during Part 2 of the testing session? | 28 | 72 | 0 |

## Exhibit 7.4: Observations of eTIMSS 2019 Eighth Grade Administration Sessions - 383 Observations (Percentage of IQCM Responses) (continued)

| Question | Yes <br> (\%) | No <br> (\%) | Not Answered or <br> Not Applicable <br> (\%) |
| :--- | :--- | :--- | :---: |
| Was the total time for the break between Part 1 and Part 2 of the <br> testing session equal to or less than 30 minutes? | 90 | 7 | 3 |
| Were the computers and USB sticks or tablets kept secure during <br> the break (e.g., the Test Administrator or a teacher remained in <br> the classroom) | 95 | 2 | 3 |
| Did the Test Administrator announce "you have 10 minutes left" <br> prior to the end of Part 2 of the testing session? | 82 | 17 | 1 |
| Were there any other "time remaining" announcements made <br> during Part 2 of the testing session? | 21 | 78 | 1 |
| Did the Test Administrator submit the data from each computer/ <br> tablet students used for the eTIMSS testing session directly after <br> the testing session? | 66 | 33 | 1 |
| Did any students finish either Part 1 or Part 2 of the assessment <br> early (logged out before the time was up)? | 81 | 18 | 1 |

In those sessions where the total testing time for a part of the paperTIMSS administration was not equal to the time allowed, many IQCMs reported that it was because students completed their work a few minutes before the allotted time had elapsed. When a few minutes over the time allowed were reported, it was usually the result of a discrepancy in timekeeping. Most classes received a 10 -minute announcement, while 29 percent of paperTIMSS and 22 percent of eTIMSS classes also received at least one more timing announcement, most frequently a 5 -minute or 2 -minute announcement. When the break exceeded 30 minutes, it was often due to schools deciding to follow their regular break schedule. These extended breaks were usually reported to be 35 to 45 minutes in duration.

In accordance with the procedure at the end of the testing session for paperTIMSS, Test Administrators were asked to collect and secure the test booklets. The IQCMs reported that in 97 percent of the fourth grade testing sessions and in 94 percent of the eighth grade sessions this occurred. After each eTIMSS session, Test Administrators were asked to upload the data to IEA's eTIMSS server, which received, stored securely, and time-stamped all uploads. The international monitors reported observing 77 percent of fourth grade Test Administrators and 66 percent of eighth grade Test Administrators submitting the data directly after the testing sessions. In the remaining sessions, the data was either uploaded via the server computer when the server method was used, or the USBs were removed with the data to be uploaded at a later time.

Exhibits 7.5, 7.6, 7.7, and 7.8 report on the activities conducted during the assessment sessions for fourth grade paperTIMSS, fourth grade eTIMSS, eighth grade paperTIMSS, and eighth grade eTIMSS,
respectively. To standardize test administration, all Test Administrators were instructed to read the script in the Test Administrator Manual to the students. IQCMs reported that in 74 percent of fourth grade and 83 percent of eighth grade paperTIMSS observations, the Test Administrators followed the script exactly. For eTIMSS, 63 percent of both fourth grade and eighth grade Test Administrators followed the script exactly. When the Test Administrator deviated from the script, nearly all modifications were reported to be "minor."

Exhibits 7.9 and 7.10 summarize observations on student compliance with instructions and overall cooperation during assessment administration for the fourth grade and eighth grade, respectively. The first two questions in each exhibit apply only to the paperTIMSS assessment since the timing and access to the eTIMSS test was controlled on the computer. According to the IQCM's observations, in almost all the paperTIMSS sessions for both grades, students complied well or very well with the instruction to stop work at the end of both part 1 and part 2. As evidenced in the third question in each exhibit for both paperTIMSS and eTIMSS, the IQCMs described the students as extremely or moderately orderly and cooperative during most of the testing sessions.

Exhibit 7.9: Fourth Grade Student Cooperation During Assessment Administration - 493 paperTIMSS Observations and 471 eTIMSS Observations (Percentage of IQCM Responses)

| Question | Extremely (\%) | Moderately (\%) | Somewhat (\%) | Hardly (\%) | Not Answered or Not Applicable (\%) |
| To what extent would you describe the students as orderly and cooperative? | 73 | 22 | 4 | 0 | 1 |

## Summary Observations of the TIMSS 2019 Testing Sessions

Exhibits 7.11 and 7.12 report on the IQCMs' general observations of the fourth grade paperTIMSS and eTIMSS assessment administrations, respectively, and Exhibits 7.13 and 7.14 report on the IQCMs' general observations of the eighth grade paperTIMSS and eTIMSS administrations, respectively. Overall, IQCMs reported that the quality of testing sessions was good, very good, or excellent ( $98 \%$ for fourth grade paperTIMSS, $96 \%$ for fourth grade eTIMSS, $98 \%$ for eighth grade paperTIMSS, and $95 \%$ for eighth grade eTIMSS). As these numbers show, the IQCMs observed very few issues overall. In only 1 percent of cases for both grade levels for paperTIMSS and 2 percent for both grade levels for eTIMSS did a student refuse to take the test. In addition, more than 92 percent of the observed testing sessions took place under favorable room conditions that were suitable for students to work without distraction. The large majority of students ( $93 \%$ for fourth grade paperTIMSS, $95 \%$ for fourth grade eTIMSS, $96 \%$ for eighth grade paperTIMSS, and $95 \%$ for eighth grade eTIMSS) followed the direction to store away everything, including electronic devices, for the duration of test administration. The IQCMs also reported that in most of observed testing sessions ( $95 \%$ for fourth grade paperTIMSS, $94 \%$ for fourth grade eTIMSS, $93 \%$ for eighth grade paperTIMSS, and $92 \%$ for eighth grade eTIMSS), students were seated in an arrangement that provided adequate space for students to work and not be distracted by one another.

Specific to eTIMSS, IQCMs reported 79 percent of fourth grade and 76 percent of eighth grade testing sessions had additional personnel in the classroom, usually an IT specialist, IT teacher, class teacher or School Coordinator. Regarding the technical problems noted by the IQCMs, most instances were addressed quickly in the classroom without any loss of data.

## Student Questionnaire Administration

All Student Questionnaires were administered on paper to all students. Exhibits 7.15 and 7.16 summarize the IQCMs' observations of the Student Questionnaire administration for fourth grade and eighth grade, respectively. IQCMs reported that in the majority of the testing sessions, the Student Questionnaires were distributed according to the Student Tracking Forms and questionnaire labels. In some cases, Test Administrators did not follow the Student Questionnaire administration script exactly. In the cases where the Test Administrator deviated from the script, the modifications were reported to be "minor" for the most part. In 28 percent of the observed testing sessions for fourth grade, Test Administrators read

Student Questionnaire questions aloud, and in 64 percent of the fourth grade sessions students answered these questions independently. It should be noted that some schools chose to administer the questionnaire on a different date than the assessment, and in these cases, IQCMs were not required to observe student questionnaire administration.

## Exhibit 7.15: Fourth Grade Student Questionnaire Administration - 964 Observations (Percentage of IQCM Responses)

## Interview with the School Coordinator

Section D was the final component of the Classroom Observation Record and involved the IQCM conducting an interview with the School Coordinator. The interview addressed issues such as the following:

- Shipment of assessment materials
- Arrangements for test administration
- Responsiveness of the national center to queries
- Necessity for make-up sessions
- Information on the target grade classes in the school

Exhibits $7.17,7.18,7.19$ and 7.20 show the overall ratings by the IQCMs for fourth grade paperTIMSS, fourth grade eTIMSS, eighth grade paperTIMSS, and eighth grade eTIMSS sessions, respectively. Almost all the School Coordinators reported that the TIMSS administration in their school went "very well" or "satisfactorily" overall. In addition, the School Coordinators noted that the School Coordinator Manual worked well for them and most other school staff members had positive attitudes toward TIMSS testing. The larger percentage in the "Needs Improvement" category for eighth grade paperTIMSS was mainly due to one country that combined School Coordinator and Test Administrator responsibilities. The remaining comments noted that the manual was either too detailed or not detailed enough.

Exhibits 7.21, 7.22, 7.23, and 7.24 present the details of the School Coordinator interviews for fourth grade paperTIMSS, fourth grade eTIMSS, eighth grade paperTIMSS, and eighth grade eTIMSS, respectively. There were only a small number of cases where components were missing from the shipments of test materials. In some cases where the School Coordinator reported not receiving all of the TIMSS materials, test materials were brought to the school on the testing day by an external Test Administrator. The School Coordinators also reported that in over 90 percent of the schools observed for TIMSS 2019, the national centers were responsive to the school's questions and concerns.

| Do you anticipate that a makeup session will be required at your <br> school? | 12 | 87 | 1 |
| If yes, do you intend to conduct one? | 10 | 2 | 84 (Not Answered) <br> 4 (Not Applicable) |
| Did the students receive any special instructions, motivational <br> talk, or incentives to prepare them for the assessment? | 74 | 25 | 2 |
| Did you provide the list of classes in the tested grade to the <br> national center? | 77 | 22 | 1 |
| If there was another international assessment, would you be <br> willing to serve as a School Coordinator? | 87 | 12 | 1 |

There were large but expected differences between schools that administered paperTIMSS and eTIMSS regarding the administration of online Teacher Questionnaires, School Questionnaires, and Early Learning Surveys. The School Questionnaire, for example, was administered online by 19 percent of schools for both the fourth grade and eighth grade in paperTIMSS countries. In comparison, the percentage of eTIMSS countries who administered this questionnaire online was 71 percent for fourth grade and 82 percent for eighth grade classes. Most of the issues reported regarding the use of online questionnaires concerned login information that was received close to the testing day.

In a large number of the visited schools, School Coordinators indicated that students were given special instructions, motivational talks, or incentives by a school official or the classroom teacher prior to testing. This ranged from 61 percent (fourth grade paperTIMSS) to 74 percent (eighth grade eTIMSS).

From 8 to 13 percent of School Coordinators anticipated needing a makeup session and most intended to conduct one.

Because the sampling of classes requires a complete list of all classes in the school at the target grade, IQCMs were also asked to verify that all classes were included in the sampling process. School Coordinators were asked how many classes of the tested grade are in the school, how many were selected to participate, and whether he/she provided the list of classes to the national center. More than 77 percent of School Coordinators confirmed that they sent a complete list of classes to the national center. Most
of the remaining School Coordinators reported that centralized databases from Ministries of Education were used instead of class lists.

As a reflection of the successful planning and implementation of TIMSS 2019, 95 percent of fourth grade paperTIMSS respondents, 87 percent of fourth grade eTIMSS respondents, 94 percent of eighth grade paperTIMSS respondents and 87 percent of eighth grade eTIMSS respondents said that they would be willing to serve as a School Coordinator in future international assessments.

## CHAPTER 8

## Creating the TIMSS 2019 International Database

Kamil Kowolik Mark Cockle Milena Taneva

Preparing the TIMSS 2019 International Database and ensuring its integrity was a complex endeavor requiring extensive collaboration among IEA Hamburg, the TIMSS \& PIRLS International Study Center, Statistics Canada, and the national centers of participating countries. Once the countries had created their data files and submitted them to IEA Hamburg, an exhaustive process of checking and editing known as "data cleaning" began. Data cleaning is the process of checking data for inconsistencies and formatting the data to create a standardized output.

For each TIMSS assessment, the overriding concerns of the data cleaning process are to ensure the following:

- All information in the database conformed to the internationally defined data structure
- The content of all codebooks and documentation appropriately reflected national adaptations to questionnaires
- All variables used for international comparisons were in fact comparable across countries (after harmonization, where necessary)
- All institutions involved in this process applied quality control measures throughout in order to assure the quality and accuracy of the TIMSS 2019 data.

For TIMSS 2019, IEA Hamburg was responsible for checking the data files from each country, applying standardized data cleaning rules to verify the accuracy and consistency of the data, and documenting any deviations from the international file structure. In addition, IEA Hamburg was responsible for processing and cleaning the data collected by eAssessment Player that delivers the assessment to students, importing student achievement response data for human-scoring into

IEA's Scoring System, and implementing machine scoring rules for achievement items according to specifications from the TIMSS \& PIRLS International Study Center.

For countries participating in eTIMSS, student achievement data files were created by IEA Hamburg from the raw data collected by the eAssessment Player as well as the achievement item scores assigned through the Scoring System. For paperTIMSS instruments (including "bridge" booklets forming the basis for a link between paperTIMSS and eTIMSS) and paper-based context questionnaires, data files were created at each country's national center and reviewed prior to submission to IEA Hamburg. The National Research Coordinators (NRCs) from each participating country collaborated with IEA Hamburg to resolve any queries which emerged during the data cleaning process, and the NRCs checked interim versions of the national/benchmarking participant database(s) produced by IEA Hamburg. The TIMSS \& PIRLS International Study Center provided the NRCs with univariate data almanacs containing summary item statistics on each variable so that the national centers could evaluate their data from an international perspective (see Chapter 10).

The TIMSS \& PIRLS International Study Center also conducted all operational psychometric analyses of the achievement and context questionnaire data, as documented in Chapter 12 (achievement scaling) and Chapter 16 (context scaling), and produced achievement scores (plausible values), and context questionnaire scores, as well as other derived variables based on the context data. Using the Within-School Sampling Software (WinW3S) ${ }^{1}$ database and response data provided by IEA Hamburg, Statistics Canada in collaboration with IEA Hamburg calculated the sampling weights, population coverage, and school and student participation rates-as documented in Chapter 3 and Chapter 9.

## Data Sources

All data collected as part of TIMSS 2019 arrived at IEA Hamburg for processing and cleaning before going to the TIMSS \& PIRLS International Study Center for verification and analysis and to Statistics Canada for calculating sampling weights and outcomes. This included data collected from: 1) paperTIMSS instruments, including achievement booklets and all context questionnaires; 2) IEA's Online SurveySystem which countries could use to administer home, teacher, and school questionnaires; and 3) the eAssessment Player that delivered the TIMSS assessment and a short questionnaire to students.

## Data Entry and Verification of Paper Instruments

Each national center was responsible for entering the responses collected in paperTIMSS achievement booklets and paper-based context questionnaires into data files using the IEA Data Management Expert (DME) software. The DME is a software system developed by IEA Hamburg that facilitates data entry

[^3]and includes validation checks to identify inconsistencies. As a general principle, national centers were instructed to enter data for any questionnaire that contained at least one valid response, discarding unused or empty instruments. This applied to countries that administered paperTIMSS as well as eTIMSS countries, as these countries administered at least some questionnaires on paper and also administered paper "bridge" booklets of achievement items to a subsample of students.

National centers entered responses from the paper instruments into data files using a predefined international codebook. The codebook defines the structure of the data to be entered and contains information about the variable names, lengths, labels, and missing codes, as well as variable ranges for continuous measures or counts and valid values for nominal or ordinal questions.

As documented in Chapter 5, countries participating in TIMSS are expected to make national adaptations to certain questions in the international questionnaires (e.g., the questions about parents' education must be adapted to the national context). Countries making such adaptations were required to adapt the codebook structure to reflect the adaptations made to the national questionnaire versions before beginning the data entry process.

To ensure consistency across participating countries, the basic rule for data entry in the DME required national staff to enter data "as is" without any interpretation, correction, truncation, imputation, or cleaning.

The guiding principles for data entry included the following:

- Responses to closed response items were coded as " 1 " if the first option was used, " 2 " if the second option was marked, and so on
- Responses to open response questions, for example number of students in the TIMSS class, were entered "as is" even if the value was outside the originally expected range
- Responses to filter questions and filter-dependent questions were entered exactly as filled in by the respondent, even if the information provided is logically inconsistent
- Non-response, ambiguous responses, responses given outside of the expected format, or conflicting responses (e.g., selection of two options in a multiple-choice question) were coded as "omitted or invalid."

As each respondent ID number was entered it was checked by the DME software for alignment with a five-digit checksum generated by WinW3S. A mistype in either the ID or the checksum resulted in an error message prompting the person entering the data to check the entry. The data-verification module of DME also checked for a range of other issues such as inconsistencies in identification codes and out-of-range or otherwise invalid codes. When such issues were flagged by the software, the individuals entering the data were prompted to resolve the inconsistency or confirm that an issue existed before resuming data entry.

## Double-Data Entry

To check data entry reliability in participating countries, national centers were required to enter a 5 percent sample of each survey instrument (achievement booklet or questionnaire) twice by two different data entry persons (punchers) operating independently. IEA Hamburg recommended that countries begin the double-data entry process as early as possible during the data capture period in order to identify possible systematic misunderstandings or mishandlings of data-entry rules and to initiate appropriate remedial actions-for example, retraining national center staff. Those entering the data were required to resolve discrepancies between the first and second data entries by consulting the original questionnaire and applying the international rules in a uniform way.

Although it was desirable that each and every discrepancy be resolved before submission of the complete dataset, the acceptable level of disagreement between the originally entered and doubleentered data was established at 1 percent or less for questionnaire data and at 0.1 percent or less level for achievement data. Values above this level required resolution of the discrepancy and re-entry of data.

The level of disagreement between the originally entered and double-entered data was evaluated by IEA Hamburg, and it was found that in general the margin of error observed for processed data was well below the required threshold.

## Data from Online Questionnaire Administration

As documented in Chapter 6: Survey Operations Procedures for TIMSS 2019, national centers had the option of administering the school, teacher, and home questionnaires online through IEA's Online SurveySystem instead of or in addition to using paper-based questionnaires. In addition, National Research Coordinators from participating countries completed the TIMSS 2019 Curriculum Questionnaire through this system.

To ensure confidentiality, national centers provided every respondent with a letter containing individual login information along with information on how to access the online questionnaire. This login information corresponded to the ID and checksum provided from WinW3S, meaning that the identity validation step occurring at the national centers for paper-based questionnaires occurred when the respondents' logged-in to the survey.

Online administration of questionnaires had a number of advantages. Because responses were collected in digital format and stored directly on the IEA Hamburg server, there was no need for data entry, reducing the workload for national centers. Also, the online system does not allow for inconsistent response patterns, meaning that the data collected had fewer inconsistencies when compared with data collected through the paper-based questionnaires. For example, if the directions ask the respondent to "Check one circle for each line," the system does not allow the respondent to check more than one response category on each line.

The TIMSS 2019 online questionnaires also include skip logic, which minimized response burden and improved data consistency. The TIMSS questionnaires have a number of questions that filter out respondents-meaning the subsequent questions are not applicable given the response to the filter question. For example, Question 10A of the eighth grade school questionnaire reads "Does your school have a school library? If no, go to Question 11." If a respondent chooses "No," the online survey skips directly to Question 11, omitting Questions 10B. Not only does the skip logic save the respondents' time, it also results in fewer inconsistencies in the data received by IEA Hamburg and instead produces planned missingness of the skipped responses which are coded in the final database as "not applicable."

## Data Verification at the National Centers

Before sending the data to IEA Hamburg for further processing, national centers carried out mandatory validation and verification steps on all entered data and undertook corrections as necessary.

While the questionnaire data were being entered, the data manager or other staff at each national center used the information from the Teacher Tracking Forms to verify the completeness of the materials. Student participation information (e.g., whether a student participated in the assessment or was absent) was entered via WinW3S.

The validation process was supported by an option in WinW3S to generate an inconsistency report. This report listed all of the types of discrepancies between variables recorded during the within-school sampling and test administration process and made it possible to cross-check these data against data entered in the DME, the database for online respondents, and the uploaded student data on the central international server.

Data managers were requested to resolve such issues before final data submission to IEA Hamburg. If inconsistencies remained or the national center could not solve them, IEA Hamburg asked the center to provide documentation on these problems.

Upon submitting the validated data to IEA Hamburg, NRCs also provided extensive documentation including hard copies or electronic scans of all original Student and Teacher Tracking Forms, Student Listing Forms, and when applicable, a report on procedural activities collected as part of the online Survey Activities Questionnaire (see Chapter 6).

## Data from eTIMSS Administration

As described in Chapter 4, the eTIMSS assessment was designed to run on PCs and tablets using USB or local server delivery. For both delivery methods, the student response data were stored in a SQLite database, the contents of which could be uploaded to the IEA Hamburg server immediately following the assessment, or later off-site. Following data upload, IEA Hamburg performed some pre-processing, verification, and cleaning steps and then student responses to constructed response items were sent to
the IEA Online Scoring System (IEA CodingExpert software), which almost immediately made student responses available to be allocated to scorers. Scoring took place directly on the IEA Hamburg serverallowing IEA Hamburg to monitor, in real time, the progress of scoring within countries.

Also available online to national centers was an upload monitor listing all the student records that had been uploaded to the IEA Hamburg server. In the rare cases that duplicate IDs were detected, the IDs were flagged and national centers indicated which record to keep. The data monitor also allows a list of IDs to be downloaded so that they can be used to update data availability status in WinW3S.

## Description of eAssessment Data

The assessment Player recorded student item responses as well as other actions taken by the student and the data were stored in a SQLite database. Student actions were broken down into timestamped events that recorded process data such as navigation behavior and tool use, but also messages to the student that were created by the system (e.g. time remaining towards the end of the test). The events for process data and student responses were stored separately, with the events in an "event table" and item responses in a "response table." There were also auxiliary tables containing the student ID together with the language in which the assessment was administered and information about whether the data had already been uploaded to the IEA server. Other tables were used for error handling.

Each event or item response was stored with both general attributes and attributes specific to that response or event. The following general attributes were recorded:

- Two timestamp parts: The first recorded events and item responses in standard Unix time format and gave the elapsed time in seconds since January 1, 1970. Since a more precise time information was needed for event data, the second timestamp added the milliseconds.
- A sequential number recording the correct sequence of actions: This number reflected the exact order of events and responses and had to coincide with the sequence obtained using the timestamp information.
- A screen ID number: This number indicated the specific screen (or item) on which the response was saved, or the event occurred.
- A page identifier: Due to the rotation of item blocks within booklets, an item could be displayed in different positions in the assessment. Therefore, it was necessary to also include a "page number" as a general attribute.
- An item ID number: For recording responses, the item identifier referred to the particular item or item input (e.g., keyboard field) on the screen. This number corresponded to a given "raw variable name" specified by the TIMSS \& PIRLS International Study Center.
- An event-type ID number: For recording events, using ID numbers instead of names helped to minimize data traffic during the assessment administration. A separate reference look-up table held the actual event names that corresponded to the event-type ID numbers.
- A response ID number: For recording responses, this identifier indicated if a response was changed later during the response process. It showed the sequential number (ID) under which the subsequent answer was saved. The final answer the student gave to an item was marked with a "NULL" value for this field.

Attributes specific to each event were stored as JavaScript Object Notation (JSON) objects. JSON objects in general hold for each attribute the name of the attribute (property) and the value of the property. Exhibit 8.1 shows an example extract from the event table for the "UI:IsLoaded" event type. This event indicates that the appropriate test form was loaded with the first item presented to the student. The event-specific attribute is the "index" which is set to zero for the first page of the test, stores as the JSON object \{"index":0\}.

Exhibit 8.1: Extract from the Event Table for Event Type "UI:IsLoaded"

| Event-Type Id | Screen ID | Page Identiffer | Information |
| :---: | :---: | :---: | :---: |
| 26 | 13617 | 0 | $\{$ "index":0\} |

In the response table, each response was stored in a separate record. The response table held the entire response history of each item the student worked on. All item responses were stored as one or more records with string of characters indicating the student response. This could be a single number, but also an extended string containing information about drawn lines or the dragging and dropping of objects. In addition, the student response table contained typed student responses that were later transferred to the Scoring System for human scoring, along with screenshot images of responses from the line-drawing tool. Responses that did not need human scoring were machine scored. For these responses, a set of detailed scoring rules provided by the TIMSS \& PIRLS International Study Center were incorporated in a scoring algorithm and applied to each response to determine the appropriate score.

## Pre-Processing and Scoring eTIMSS Data

Some pre-processing steps were required to prepare eAssessment data in a suitable format for scoring and further processing. Data uploads from the eTIMSS Players were processed at IEA Hamburg by several data servers that received and time stamped and then extracted the raw data from the uploaded SQLite databases into the "central" SQL database for all countries. This new structure contained a separate database for each country and grade, including all data from the original SQLite databases with the addition of identifiers relating to the import of data and additional fields for scoring purposes.

For eTIMSS countries, the new mode of administration allowed for a substantial portion of the digital items to be machine scored, particularly in mathematics. For eTIMSS items suitable for machinescoring, the TIMSS \& PIRLS International Study Center used scoring guides as the basis for developing machine scoring specifications that could be accurately applied without human judgment of student responses. Developing the machine scoring specifications involved testing each item in the eTIMSS Player, reviewing the output, and writing rules in terms of the output to classify all possible responses to a code in the item's scoring guide. The scoring unit at IEA Hamburg reviewed all specifications and provided feedback on an item-by-item basis, resulting in several rounds of revision until the rules for all items were clarified. The scoring unit at IEA Hamburg then applied the scoring rules for all machine-scored items and the data analysis team at the TIMSS \& PIRLS International Study Center independently replicated the results to validate the scoring.

The IEA Scoring System (CodingExpert software) was used by NRCs and their scoring staff to score the eTIMSS constructed response items that were not suitable for machine scoring. Although scoring supervisors controlled the distribution of responses to scorers within countries, the responses themselves became available in the system soon after upload (with some delay due to the asynchronous handling of the import to the central database and thence to the scoring system). To avoid unnecessary scoring, therefore, it was essential that any duplicates in the central database were dealt with before import to the scoring system. In addition to measures to prevent a database from being uploaded a second time from the client side, checks were made to the results database creation date and content to ensure any possible duplicates were flagged before import. There were, however, some kinds of duplicate records that could be legitimate. Two databases with the same student ID but with different creation times could have originated in several scenarios. For example, this could be simply a case of the test administrator mistakenly using the same ID twice for two different students, or an interruption in the assessment may have led to part 1 being conducted from one USB stick and part 2 from a second. Such cases needed to be reconciled by IEA Hamburg's data processing procedures. When scoring was completed, the student response data were transferred to tables prepared for import into the data processing system (DPE) employed at IEA Hamburg for all large-scale international assessments.

## Cleaning the International and National Databases

To ensure the integrity of the international database, a uniform data cleaning process was followed, involving regular consultation between IEA Hamburg and the NRCs. After each country had submitted its data, codebooks, and documentation, IEA Hamburg, in collaboration with the NRCs, conducted a four-step cleaning procedure upon the submitted data and documentation:

- A structural check
- A check of the identification (ID) variables
- Linkage cleaning
- Background cleaning

The data cleaning process included numerous iterations of the four-step cleaning procedure and were completed on each national data set in close collaboration with national centers. This repeated multistep cleaning ensured that all data were properly cleaned and that any new errors that could have been introduced during the data cleaning were rectified. The cleaning process was repeated as many times as necessary until all data were made consistent and comparable. Any inconsistencies detected during the cleaning process were resolved in collaboration with national centers, and all corrections made during the cleaning process were documented in a cleaning report, produced for each country.

After the final cleaning iteration, each country's data were sent to Statistics Canada for the calculation of sampling weights, and then the data, including sampling weights, were sent to the TIMSS \& PIRLS International Study Center so that the psychometric analyses (as described in Chapter $\underline{11}$ and Chapter 12) could be conducted. The NRCs were provided with interim data products to review at different points in the process.

## Preparing National Data Files for Analysis

The main objectives of the data cleaning process were to ensure that the data adhered to international formats, that school, teacher, and student information could be linked across different survey files, and that the data reflected the information collected within each country in an accurate and consistent manner.

As illustrated in Exhibit 8.2, the program-based data cleaning consisted of a set of activities explained in the following subsections. IEA Hamburg carried out all of these activities in close communication with the national centers as well as with the TIMSS \& PIRLS International Study Center for achievement data.

Exhibit 8.2: Overview of Data Processing at IEA Hamburg

## Checking Documentation, Import, and Structure

For each country, data cleaning began with a review of data file structures and its data documentation, including a review of National Adaptation Forms, Student Tracking Forms, Teacher Tracking Forms, Student-Teacher Linkage Forms, and the Survey Activities Questionnaire.

After the review, IEA Hamburg first merged the tracking information and sampling information captured in the WinW3S database with the student-level database containing the corresponding student
data from eTIMSS or paperTIMSS achievement assessments. During this step, IEA Hamburg staff also merged the data from the school and teacher questionnaires for both the online and paper modes of administration. At this stage, data from the different sources was transformed and imported into one SQL database so that this information would be available during all further data-processing stages.

The first checks identified differences between the international and the national file structures. Some countries made adaptations (such as adding national variables or omitting or modifying international variables) to their questionnaires. The extent and nature of these changes differed across countries: some countries administered the questionnaires without any modifications (apart from translations and necessary adaptations relating to cultural or language-specific terms), whereas other countries inserted response categories within existing international variables or added national variables.

To keep track of adaptations, staff at the TIMSS \& PIRLS International Study Center asked the national centers to complete National Adaptation Forms. In their adaptations, countries sometimes modified the structure and values of the international codebooks, and if IEA Hamburg had to recode variables in the national data files to ensure that the resulting data remained comparable across countries. The national adaptation process is described in Chapter 5 and details about country-specific adaptations to the international instruments can be found in Supplement 2 of the TIMSS 2019 User Guide for the International Database.

IEA Hamburg then discarded variables created purely for verification purposes during data entry and made provision for adding new variables necessary for analysis and reporting, including reporting variables, derived variables, sampling weights, and scale scores.

Once IEA staff had ensured that each data file matched the international format, they applied a series of standard data cleaning rules for further processing. Processing during this step employed software developed by IEA Hamburg that identifies and corrects inconsistencies in the data. Each potential problem flagged at this stage was identified by a unique problem number, and then described and recorded in a database. The action taken by the cleaning program or IEA Hamburg staff with respect to each problem was also recorded.

IEA Hamburg referred problems that could not be rectified automatically to the responsible NRC so that national center staff could check the original data-collection instruments and tracking forms to trace the source of these errors. Wherever possible, staff at IEA Hamburg suggested a remedy and asked the national centers to either accept it or propose an alternative. If a national center could not solve the issue through verification of the instruments or forms, IEA Hamburg applied a general cleaning rule to the files to rectify the error. When all automatic updates had been applied, IEA Hamburg staff used SQL recoding scripts to directly apply any remaining corrections to the data files.

## Checking Identification Variables

Each record in a data file needs to have a unique identification number. The existence of records with duplicate ID numbers in a file implies an error of some kind. Some countries administered the school, teacher, and home questionnaire (fourth grade only) online in addition to the paper mode. Therefore, by mistake a respondent could have completed both the paper and the online versions of the questionnaire. Similarly, it was possible for an eTIMSS login to be used (and uploaded) twice. If two records in a TIMSS 2019 database shared the same ID number and contained exactly the same data, IEA Hamburg deleted one of the records and kept the other one in the database. In the rare case that both records contained different data and IEA staff found it impossible to identify which record contained the more reliable or complete version of the data, national centers were asked which record to keep.

Although the ID cleaning covered all data from all instruments, it focused mainly on the student data file. In addition to checking the unique student ID number, it was crucial to check variables pertaining to student participation and exclusion status, as well as students' birth dates and dates of testing in order to calculate student age at the time of testing. The Student Tracking Forms provided an important tool for resolving anomalies in the database.

As mentioned previously, IEA Hamburg conducted all cleaning procedures in close cooperation with the national centers. After national center staff had cleaned the identification variables, they passed the clean databases with information about student participation and exclusion on to Statistics Canada, which used this information to calculate students' participation rates, exclusion rates, and student sampling weights.

## Checking Linkages

As data on students, parents, teachers, and schools appeared in a number of different data files, a process of linkage cleaning was implemented to ensure that the data files would correctly link together. The linking of the data files followed a hierarchical system of identification codes that included school, class, and student components. These codes linked the students with their class and/or school membership. Further information on linkage codes can be found in Chapter 6: Survey Operations Procedures for TIMSS 2019.

Linkage cleaning consisted of a number of checks to verify that student entries matched across achievement files, student context questionnaire data files, scoring reliability files, and home background files. In addition, at this stage, checks were conducted to ensure that teacher and student records linked correctly to the appropriate schools. The Student Tracking Forms, Teacher Tracking Forms, and StudentTeacher Linkage Forms were crucial in resolving any anomalies. IEA Hamburg also liaised with NRCs about any problematic cases, and the national centers were provided with standardized reports listing all inconsistencies identified within the data.

## Resolving Inconsistencies in Context Questionnaire Data

The amount of inconsistent and implausible responses in questionnaire data files varied considerably across countries. IEA Hamburg determined the treatment of inconsistent responses on a question-byquestion basis, using all available documentation to make an informed decision. IEA Hamburg staff also checked all questionnaire data for consistency across the responses given. For example, Question 1 in the school questionnaire asked for the total school enrollment in all grades, and Question 2 asked for the enrollment in the target grade only. Logically, the number given as a response to Question 2 could not exceed the number provided by school principals in Question 1. Similarly, it is not possible that the number of years a teacher has been teaching altogether (Question 1 in the teacher questionnaires) exceeds the minimum possible age of a beginning teacher in all participating countries (Question 3 in the teacher questionnaires). IEA Hamburg flagged inconsistencies of this kind and then asked the national centers to review these issues. IEA staff recoded those cases that could not be corrected as "invalid."

Filter questions, which appeared in some questionnaires, directed respondents to a particular set of questions that only applies to a subset of respondents. IEA Hamburg applied the following cleaning rule to these filter questions and the dependent questions that followed, for instance: If a respondent answered "No" to Question 10A in the school questionnaire "Does your school have a school library?" IEA Hamburg recoded any responses to the dependent question 10B as "logically not applicable." Also, following the same example, if the filter question was omitted but at least one valid response was found in the dependent questions then IEA Hamburg recoded the filter question to "Yes." This of course is only possible for dichotomous filter questions (e.g., with response options such "Yes/No").

IEA Hamburg also applied what are known as split variable checks to questions where the answer was coded into several variables. For example, Question 5 in the student questionnaire asked students: "Do you have any of these things at your home?" Student responses were captured in a set of nine variables, each one coded as "Yes" if the corresponding "Yes" option was filled in and "No" if the "No" option was filled in. Occasionally, students checked the "Yes" boxes but left the "No" boxes unchecked. Because, in these cases, it was clear that the unchecked boxes meant "No," these responses were recoded accordingly.

In addition, student reports to items on gender and age in the student questionnaire were checked against the tracking information provided by the School Coordinator or Test Administrator during the within-school sampling and test/questionnaire administration process. When information on gender or birth year and month was missing in the student questionnaire but the student participated, this information, when available, was copied over from the tracking data to the questionnaire. If discrepancies were found between existing tracking and questionnaire gender and age data, IEA Hamburg queried the case with the national center, and the national center investigated which source of information was correct. If unresolved, tracking data was used rather than questionnaire data (or vice versa for some items at the eighth grade).

## Handling of Missing Data

Two types of entries were possible during the TIMSS 2019 data capture: valid data values and missing data values. Missing data can be assigned a value of omitted/invalid, or not administered during data capture. IEA Hamburg applied additional missing codes to the data to facilitate further analyses. This process led to four distinct types of missing data in the international database:

- Omitted or invalid: The respondent had a chance to answer the question but did not do so, leaving the corresponding item or question blank. This code was also used if the response was uninterpretable or out-of-range.
- Not administered: This signified that the item or question was not administered to the respondent, which meant that the respondent could not read and answer the question. The not administered missing code was used for those student test items that were not in the set of assessment blocks administered to a student either deliberately (due to the rotation of assessment blocks) or, in rare cases, due to technical failure or incorrect translations. This missing code was also used for those records that were included in the international database but did not contain a single response to one of the assigned questionnaires. For example, this situation applied to home questionnaire data for students who participated in the student test but the parent/guardian did not answer the home questionnaire. In addition, the not administered code was used for individual questionnaire items that a national center decided not to include in the country-specific version of the questionnaire.
- Logically not applicable: The respondent answered a preceding filter question in a way that made the following dependent questions not relevant to him or her.
- Not reached: This applied only to the individual items of the student achievement test and indicated those items that students did not attempt due to a lack of time. "Not reached" codes were derived as follows: First, the last answer given by a student in a session is identified. This could be either a valid or invalid response to an item. The first omitted response after this last answer is coded as "omitted," but all following responses to these items in the session are then coded as "not reached." For example, the response pattern "1942999999" (where "9" represents "omitted") is recoded to "19429RRRRR" (where " $R$ " represents "not reached").

## Data Cleaning Quality Control

Because TIMSS 2019 was a large and highly complex study with very high standards for data quality, maintaining these standards required an extensive set of interrelated data checking and data cleaning procedures. To ensure that all procedures were conducted in the correct sequence, that no special
requirements were overlooked, and that the cleaning process was implemented independently of the persons in charge, the data quality control process included the following steps:

- Thorough testing of all data cleaning programs: Before applying the programs to real datasets, IEA Hamburg applied them to simulation datasets containing all possible problems and inconsistencies
- Registering all incoming data and documents in a dedicated database: IEA Hamburg recorded the date of arrival as well as specific issues requiring attention
- Carrying out data cleaning according to strict rules: Deviations from the cleaning sequence were not possible, and the scope for involuntary changes to the cleaning procedures was minimal
- Documenting all systematic data recoding that applied to all countries: IEA Hamburg recorded all changes to data in the comprehensive cleaning documentation provided to national centers
- Logging every "manual" correction to a country's data files in a recoding script: Logging these changes, which occurred only occasionally, allowed IEA Hamburg staff to undo changes or to redo the whole manual-cleaning process at any later stage of the data cleaning process
- Repeating, on completion of data cleaning for a country, all cleaning steps from the beginning: This step allowed IEA Hamburg to detect any problems that might have been inadvertently introduced during the data cleaning process
- Working closely with national centers at various steps of the cleaning process: IEA Hamburg provided national centers with the processed data files and accompanying documentation so that center staff could thoroughly review and correct any identified inconsistencies.

IEA Hamburg compared national adaptations recorded in the documentation for the national datasets with the structure of the submitted national data files. IEA Hamburg staff then recorded any identified deviations from the international data structure in the national adaptation database and for the supplementary materials provided with the TIMSS 2019 User Guide for the International Database. Whenever possible, IEA Hamburg recoded national deviations to ensure consistency with the international data structure.

## Interim Data Products

Before the TIMSS 2019 International Databases were finalized, three major interim versions of the data files were sent to each country-each country receiving only its own data. In addition, countries that administered eTIMSS received files with student raw responses. These raw response files are the
trace of what students answered and are in this sense comparable to the completed paper booklets that paperTIMSS countries would have available for checking. The first version of the databases was sent as soon as the data could be considered "clean" as regards identification codes and linkage issues. Documentation, with a list of the cleaning checks and corrections made in the data, was included in the first sendout to enable the National Research Coordinators to review the cleaning process before the $7^{\text {th }}$ NRC meeting Agadir, Morocco in December 2019. A second version of the data was sent to the countries when all national adaptations and the feedback resulting from the review of the first version were implemented at the end of February 2020. National Research coordinators were asked to confirm that the data is ready for the operational psychometric analysis used for achievement scaling. A third version of the data files was sent to countries when the weights and international achievement scores were available and had been merged with the data files. This version, sent to the countries in advance of the $8^{\text {th }}$ NRC Meeting in June 2020 contained only those records that were used in the analysis and reports to be released in December 2020 and satisfied the sampling standards, allowed the NRCs to replicate the results presented in the international reports.

Interim data products were accompanied by detailed data processing and national adaptation documentation, codebooks, and summary statistics. The summary statistics were created by the TIMSS \& PIRLS International Study Center and included weighted univariate statistics for all questionnaire variables for each country. For categorical variables, representing the majority of variables, the percentages of respondents choosing each of the response options were displayed. For continuous numeric variables, various descriptive statistics were reported, including the minimum, maximum, mean, median, mode, and percentiles. For both types of variables, the percentages of missing data were reported. Additionally, for the achievement items, the TIMSS \& PIRLS International Study Center provided item analysis and reliability statistics listing information regarding the number of valid cases, percentages, percentage correct, Rasch item difficulty, scoring reliability, and so forth. These statistics were used for a more in-depth review of the data at the international and national levels in terms of plausibility, unexpected response patterns, etc. More information on item almanacs and reviewing item statistics is available in Chapter 10.

## Final Product-the TIMSS 2019 International Databases

The data cleaning effort implemented at IEA Hamburg ensured that the TIMSS 2019 international databases contained high-quality data. More specifically, the process ensured that:

- Information coded in each variable was internationally comparable
- National adaptations were reflected appropriately in all variables
- All entries in the database could be successfully linked within and across levels
- Sampling weights and student achievement scores were available for international comparisons.

Supplements to the TIMSS 2019 User Guide for the International Database document all national adaptations made to questionnaires by individual countries and how they were handled in the data. The description of country-specific items also can be found in this supplement, as well as recoding requirements by the TIMSS \& PIRLS International Study Center.

## ANALYSIS AND REPORTING

2019

## CHAPTER 9

## Sample Implementation in TIMSS 2019

Sylvie LaRoche
Pierre Foy

## Overview

Rigorous sampling of schools and students was a key component of the TIMSS 2019 project. Implementing the sampling plan was the responsibility of the National Research Coordinator (NRC) in each participating country. NRCs were supported in this endeavor by the TIMSS 2019 sampling consultants, Statistics Canada, and the Sampling Unit of IEA Hamburg. Sampling consultants conducted the school sampling for most countries and trained NRCs in using the Windows ${ }^{\circledR}$ Within-School Sampling Software (WinW3S) provided by IEA Hamburg to implement within-school sampling. As an essential part of their sampling activities, NRCs were responsible for providing detailed documentation describing their national sampling plans (sampling data, school sampling frames, and school sample selections). The documentation for each TIMSS participant was reviewed and completed by the sampling consultants, including detailed information on coverage and exclusion levels, stratification variables, sampling participation rates, and variance estimates. The TIMSS \& PIRLS International Study Center and the TIMSS 2019 Sampling Referee, Dr. Keith Rust of Westat, Inc., used this information to evaluate the quality of the samples. TIMSS 2019 marked the beginning of the TIMSS transition to computer based assessment, with countries having the option of administering the new computer-based version of the 2019 assessment, known as eTIMSS, or the paper-and-pencil version as in previous assessment cycles (paperTIMSS). In order to control for mode effects while linking the two versions to the TIMSS achievement scales and to safeguard the measurement of trends from previous assessments, eTIMSS countries also provided a separate sample of bridge data (see Chapter 3 of this volume).

This chapter gives a summary of the major characteristics of the national samples for TIMSS 2019, followed by a summary of the major characteristics of the bridge samples for trend countries that participated in eTIMSS. More detailed descriptions of the sample design for each country, including details of population coverage and exclusions, stratification variables, and schools' sampling allocations, are provided in Appendix 9A: Characteristics of National Samples.

## Target Population

As described in Chapter 3 (Sample Design), the international target populations for the TIMSS 2019 fourth and eighth grade assessments were defined as the grades that represented 4 and 8 years of formal schooling, respectively, counting from the first year of primary or elementary schooling. Countries could assess either one or both student populations. In addition, at the fourth grade for the TIMSS 2019 cycle, countries could administer a less difficult mathematics assessment, consisting of one third of the items from the regular assessment and two-thirds less difficult items, along with the regular fourth grade science assessment.

Albania, Bosnia and Herzegovina, Kosovo, Kuwait, Morocco, North Macedonia, Montenegro, Pakistan, Philippines, and Saudi Arabia chose to administer the less difficult mathematics assessment at the fourth grade while South Africa administered the less difficult mathematics assessment at the fifth grade.

Exhibits 9.1 and 9.2 present the grades identified as the target grades for sampling by each country, and include the number of years of formal schooling that the grades represent and the average age of students in the target grades at the time of testing.

For most countries, the target grades did indeed turn out to be the grades with 4 and 8 years of schooling, i.e., fourth and eighth grades, respectively. However, in England and New Zealand, children begin primary school at an early age. ${ }^{1}$ Therefore, these countries administered the TIMSS fourth grade assessment in the fifth year of schooling. The TIMSS eighth grade assessment for England and New Zealand was administered in the ninth year of schooling. Norway chose to assess its fifth and ninth grades to obtain better comparisons with Sweden and Finland.

To provide a better match with the demands of the assessments, South Africa and Turkey availed themselves of the option to assess students at a higher grade. South Africa administered the TIMSS fourth grade with less difficult mathematics assessment at the fifth grade and Turkey administered the TIMSS fourth grade assessment at the fifth grade. South Africa administered the eighth grade assessment at the ninth grade, as did its benchmarking provinces of Gauteng and Western Cape.

## Exhibit 9.1: National Grade Definition - TIMSS 2019 - Fourth Grade

| Country | Country's Name <br> for Grade Tested | Years of <br> Formal <br> Schooling | Average Age <br> at |
| :--- | :---: | :---: | :---: |
| Albania | Grade 4 | 4 | 10.0 |
| Armenia | Grade 4 | 4 | 9.9 |
| Australia | Year 4 | 4 | 10.1 |
| Austria | Grade 4 | 4 | 10.4 |

1 Given the cognitive demands of the assessments, TIMSS wants to avoid assessing very young students. Thus, TIMSS recommends assessing the next higher grade (i.e., fifth grade for fourth grade TIMSS and ninth grade for eighth grade TIMSS) if, for fourth grade students, the average age at the time of testing would be less than 9.5 years and, for eighth grade students, less than 13.5 years.

Exhibit 9.1: National Grade Definition - TIMSS 2019 - Fourth Grade (continued)

| Country | Country's Name for Grade Tested | Years of Formal Schooling | $\begin{gathered} \text { Average Age } \\ \text { at } \\ \text { Time of Testing } \end{gathered}$ |

| Dubai, UAE | Grade 8 | 8 | 13.9 |

## National Coverage and Exclusions of the TIMSS 2019 National Samples

Exhibits 9.3 and 9.4 summarize population coverage and exclusions for the TIMSS 2019 target populations.

## Coverage

National coverage of the international target population was generally comprehensive, with some exceptions. At the fourth grade, these exceptions included Canada (assessed students only from the provinces of Alberta, Manitoba, Newfoundland, Ontario and Quebec) and Georgia (assessed only students taught in Georgian). These participants chose a national target population that was less than the international target population. At the eighth grade, all countries except Georgia (assessed only students taught in Georgian) sampled from 100 percent of their international desired population. For the exceptions where coverage was below 100 percent, the results were footnoted in the TIMSS 2019 international reports.

## School-Level and Student-Level Exclusions

Within the national target population, it was possible to exclude certain types of schools and students. For the most part, school-level exclusions consisted of schools for students with disabilities and very small or remote schools. Occasionally, schools were excluded for other reasons, as documented in Appendix 9A: Characteristics of National Samples.

Student-level, or within-school, exclusions generally consisted of students with disabilities or students who could not be assessed in the language of the test. For most participants, the overall percentage of excluded students (combining school and within-school levels) was 5 percent or less after rounding. However, at the fourth grade, Canada, England, Kazakhstan, Kosovo, Latvia, Lithuania, New Zealand, Pakistan, Philippines, Portugal, Russian Federation, Saudi Arabia, Serbia, Slovak Republic, Turkey (5), United States, and the benchmarking participants Ontario and Dubai had exclusions accounting for between 5 and 10 percent of the desired population after rounding, and Singapore had exclusions exceeding 10 percent. At the eighth grade, Egypt, Kazakhstan, Russian Federation, Saudi Arabia, Singapore, Sweden, and the benchmarking participant Dubai had exclusions accounting for between 5 and 10 percent of the national target population after rounding. Israel had exclusions exceeding 10 percent.

Results for participants with an exclusion rate of more than 5 percent after rounding were annotated in the international reports.

Exhibit 9.3: Coverage of TIMSS 2019 - Fourth Grade Target Population

| Country | International Target Population |  | Exclusions from National Target Population |  |  |

| Western Cape, RSA (9) | $100 \%$ | $0.8 \%$ | $0.3 \%$ | $1.1 \%$ |  |
| Abu Dhabi, UAE | $100 \%$ | $0.9 \%$ | $0.8 \%$ | $1.7 \%$ |  |
| 2 Dubai, UAE | $3.0 \%$ | $2.5 \%$ | $5.5 \%$ |  |  |

1 National Target Population does not include all of the International Target Population.
2 National Defined Population covers $90 \%$ to $95 \%$ of National Target Population.
3 National Defined Population covers less than $90 \%$ of National Target Population (but at least 77\%).

## Target Population Size of the TIMSS 2019 National Samples

Exhibits 9.5 and 9.6 show the number of schools and students in each participant's target population ${ }^{2}$ and sample, as well as an estimate of the student population size based on the sample data. The target population figures are derived from the sampling frame used to select the TIMSS 2019 samples, while the sample figures are based on the number of sampled schools and students that participated in the assessments. The student population sizes estimated from the sample were computed using sampling weights, which are explained in more detail in Chapter 3. The student population size based on the sampling frame did not take into account the portion of the population excluded within sampled schools and made no adjustment for changes in the population between the date when the information in the sampling frame was collected and the date of the TIMSS 2019 data collection-usually a 2-year interval. Nevertheless, a comparison of the two figures of population size can be seen as a validity check on the sampling procedure. In most cases, the population size estimated from the sample closely matched the population size from the sampling frame.

## Stratification

TIMSS 2019 National Research Coordinators consulted with Statistics Canada and IEA Hamburg to identify the stratification variables to be included in their sampling plans. Exhibits 9.7 and 9.8 provide the list of explicit and implicit stratification variables implemented by the countries participating at the fourth grade at the eighth grade respectively.

Exhibit 9.7: Stratification Variables - TIMSS 2019 - Fourth Grade

| Country | Explicit Stratification <br> Variables | Number of <br> Explicit Strata | Implicit Stratification <br> Variables |
| :--- | :--- | :---: | :--- |
| Albania | School type (2) <br> Urbanization (2) | 3 | Urbanization (2) | | Armenia | Region (10) | 10 | None |
| :--- | :--- | :--- | :--- |
| Australia | State or territory (8) | 8 | School type (3) <br> Geographic location (3) <br> Socioeconomic status (2) |

## Meeting TIMSS 2019 Standards for Sampling Participation

TIMSS 2019 participants understood that the goal for sampling participation was 100 percent for all sampled schools, classrooms, and students. Guidelines for reporting achievement data for participants securing less than full participation were modeled after IEA's previous TIMSS assessment cycles. As summarized below in Exhibit 9.9, countries were assigned to one of three categories on the basis of their sampling participation. Countries in Category 1 were considered to have met all TIMSS 2019 sampling requirements and to have acceptable participation rates. Countries in Category 2 met the participation requirements only after including replacement schools. Countries that failed to meet the participation requirements even with the use of replacement schools were assigned to Category 3. One of the main goals for quality data in TIMSS 2019 was to have as many countries as possible achieve Category 1 status.

## Exhibit 9.9: Categories of Sampling Participation

Acceptable sampling participation rate without the use of replacement schools.
In order to be placed in this category, a country had to have:

- An unweighted school response rate without replacement of at least $85 \%$ (after rounding to nearest whole percent) AND an unweighted student response rate (after rounding) of at least 85\%
OR
- A weighted school response rate without replacement of at least $85 \%$ (after rounding to nearest whole percent) AND a weighted student response rate (after rounding) of at least $85 \%$
OR
- The product of the (unrounded) weighted school response rate without replacement and the (unrounded) weighted student response rate of at least $75 \%$ (after rounding to the nearest whole percent).
Countries in this category would appear in the tables and figures in international reports without annotation, and will be ordered by achievement as appropriate.

Acceptable sampling participation rate only when replacement schools are included. A country would be placed in this category 2 if:

- It failed to meet the requirements for Category 1 but had a weighted school response rate without replacement of at least $50 \%$ (after rounding to the nearest percent)

## AND HAD EITHER

- A weighted school response rate with replacement of at least $85 \%$ (after rounding to nearest whole percent) AND a weighted student response rate (after rounding) of at least $85 \%$

OR

- The product of the (unrounded) weighted school response rate with replacement and the (unrounded) weighted student response rate of at least 75\% (after rounding to the nearest whole percent).

Countries in this category would be annotated with $\dagger$ in the tables and figures in international reports, and ordered by achievement as appropriate.

Exhibit 9.9: Categories of Sampling Participation (continued)
Unacceptable sampling response rate even when replacement schools are included. Countries that could provide documentation to show that they complied with PIRLS sampling procedures and requirements but did not meet the requirements for Category 1 or Category 2 would be placed in Category 3.
Countries in this category would be annotated with $\ddagger$ if they nearly met the requirements for Category 2. Countries would be annotated with $\equiv$ if they failed to meet the participation requirements but had a school participation rate of at least $50 \%$ before the use of replacement schools. At last, if none of these conditions are met, countries would appear in a separate section of the achievement tables, below the other countries, in international reports. These countries would be presented in alphabetical order.

## Participation Rates of the TIMSS 2019 National Samples

Exhibits 9.10 through 9.13 present the school, classroom, student, and overall weighted and unweighted participation rates for each of the participants in the TIMSS 2019 fourth and eighth grade assessments, respectively. Almost all participants had excellent participation rates and belonged in Category 1. At the fourth grade, Belgium (Flemish), Denmark, Hong Kong SAR, Northern Ireland, Norway (5), and the United States achieved the minimum acceptable participation rate only after including replacement schools, and therefore their results were annotated with a dagger ( $\dagger$ ) in the achievement exhibits of the international reports (Category 2). Despite efforts to secure full participation, Netherlands did not meet the required sampling participation rate even with the use of replacement schools and were annotated with a triple-dagger $(\equiv)$ in the achievement exhibits of the international reports.

At the eighth grade, Hong Kong SAR, New Zealand, Norway (9), the United States achieved the minimum acceptable participation rates only after including replacement schools, and therefore their results were annotated with a dagger $(\dagger)$ in the achievement exhibits of the international reports (Category 2). Finally, the benchmarking participant of Quebec, Canada, nearly met the required sampling participation rate at the fourth and eighth grades with the use of replacement schools and were annotated with a double-dagger $(\ddagger)$ in the achievement exhibits of the international reports (Category 3).

Exhibit 9.10: Participation Rates (Weighted) - TIMSS 2019 - Fourth Grade

Students attending a sampled class at the time the sample was chosen but leaving the class before the assessment was administered were classified as withdrawn.
Students with a disability or language barrier that prevented them from participating in the assessment were classified as excluded.
Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as absent.

Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as absent.

## TIMSS 2019 Trends in Student Populations

Because an important goal of the TIMSS 2019 assessment was to measure changes in students' mathematics and science achievement across assessment cycles, it was important to track any changes over time in population composition and coverage that might be related to student achievement. Exhibits 9.18 and 9.19 present, for each country, trends across cycles (2019, 2015, 2011, 2007, 2003, and 1995 at the fourth grade and 2019, 2015, 2011, 2007, 2003, 1999, and 1995 at the eighth grade) in four important characteristics of the assessment populations: number of years of formal schooling, average student age, percent of students in the national target population excluded from the assessment, and overall participation rates after using replacements. Most countries and benchmarking participants were very similar with regard to these characteristics across the assessment cycles, although there have been changes in some countries in the age and grade structure of the assessed populations, in the target population coverage, and in the exclusion rate.

In terms of changes in age structure, the Russian Federation has undergone changes in the age at which children enter schools that are reflected in their samples. In 2003, the Russian fourth grade sample contained third grade students from some regions and fourth grade students from others, whereas all
students were in the fourth grade by 2007. At the eighth grade, there was still a mixture of seventh and eighth grade students in 2007, but by 2011 the sample was all eighth grade students, with correspondingly a higher average age. Turkey chose to assess students at the fifth grade in 2019, breaking the trend with previous cycles.

National coverage of the international target population was generally comprehensive for most countries and has not changed across assessments, with just a few exceptions. At the fourth grade, Kuwait assessed students from both the public and private schools in the 2019 and 2015 cycles while they assessed only students from the public schools in prior cycles. As a result, the 2019 trend is only with the 2015 data.

In most countries, exclusion rates did not exceed the TIMSS 2019 guidelines of 5 percent, and have not changed very much across assessments cycles. At the fourth grade, Denmark reduced its overall exclusion rate of 4.4 percent between 2015 and 2019 by providing more precise guidelines on withinschool exclusions of special needs students. During that same period, Serbia also decreased its overall exclusion rate by reducing their within-school exclusion of non-native language speakers and by excluding less very small schools. On the other hand, the student exclusion rate was higher in 2019 than in 2015 at the fourth grade by more than 1.5 percentage points in Belgium (Flemish), England, New Zealand, Russian Federation, Saudi Arabia, and Singapore. At the eighth grade, those with increases of more than 1.5 percentage points in their exclusions since 2015 included Egypt, England, Hong Kong SAR, Oman, Russian Federation, Saudi Arabia, Singapore, and Turkey.

* Represents years of schooling counting from the first year of ISCED Level 1.

Data are included only for assessment years with comparable results for each country.
See Exhibit 9.3 for population coverage notes 1,2 , and 3 . See Exhibit 9.10 for sampling guidelines and sampling participation notes $\dagger$, $\ddagger$, and $\equiv$.
p Tested the same cohort of students as other countries, but later in the assessment year.
Armenia began testing younger students in 2011 due to educational reforms.
Bahrain in 2015 administered both TIMSS and TIMSS Numeracy assessments to fourth grade students. Results for 2015 in mathematics are based on the average of both.
Georgia in 2011 excluded schools in South Ossetia and Abkhazia due to lack of access and absence of official statistics. Abkhazia refugee schools in other territories of Georgia were included in the sample frame.
Iran in 2015 administered both TIMSS and TIMSS Numeracy assessments to fourth grade students. Results for 2015 in mathematics are based on the average of both.
Results for Lithuania before 2015 do not include students taught in Polish or Russian.
Morocco and the Philippines in 2019 administered the less difficult fourth grade mathematics assessment.
Kuwait and Morocco in 2015 administered both TIMSS and TIMSS Numeracy assessments to fourth grade students. Results for 2015 in mathematics are based on the average of both.
Saudi Arabia and South Africa in 2019 administered the less difficult fourth grade mathematics assessment. South Africa in 2015 participated in only TIMSS Numeracy at the fifth grade.
Ontario and Quebec in 1995 participated as part of Canada. A dash (-) indicates comparable data not available.

* Represents years of schooling counting from the first year of ISCED Level 1.

Data are included only for assessment years with comparable results for each country.
See Exhibit 9.4 for population coverage notes 1,2 , and 3 . See Exhibit 9.11 for sampling guidelines and sampling participation notes $\dagger, \ddagger$, and $\equiv$. p Tested the same cohort of students as other countries, but later in the assessment year.
Egypt's 2015 exclusion rate may be underestimated.
Georgia in 2011 excluded schools in South Ossetia and Abkhazia due to lack of access and absence of official statistics. Abkhazia refugee schools in other territories of Georgia were included in the sample frame.
Results for Lithuania before 2015 do not include students taught in Polish or Russian. Lithuania in 1999 tested the same cohort of students as other countries, but later in the assessment year.
Ontario and Quebec in 1995 and 1999 participated as part of Canada. A dash (-) indicates comparable data not available.

## Characteristics of the Bridge Samples

As mentioned earlier, eTIMSS countries also provided a separate sample of bridge data in order to control for mode effects while linking the two versions to the TIMSS achievement scales and to safeguard the measurement of trends from previous assessments.

The bridge data result from administering the paper version of the trend items (eight blocks of items for each subject and grade that also were administered in 2015) to a separate, equivalent sample of students during the main data collection. The following sections of this chapter provide a summary of the major characteristics of the bridge samples for trend countries that participated in eTIMSS.

## Overlap between the Bridge and eTIMSS Samples

As mentioned in Chapter 3, it was important that the eTIMSS countries' bridge samples mirror their main eTIMSS samples as closely as possible. For operational reasons, it was not possible to administer both
the eTIMSS assessment and bridge assessment to the same students or in the same class. Consequently, bridge samples were obtained by a) selecting an additional class from a subset of the sampled schools, or b) selecting a separate sample of schools, or c) a combination of the two approaches. The sampling experts from Statistics Canada worked with each country during the sampling development stage to develop an optimal strategy for selecting the bridge sample.

Exhibits 9.20 and 9.21 present the number and percentage of students from the bridge sample that came from the eTIMSS schools.

## National Coverage and Exclusions of the Bridge Samples

The coverage and school exclusions prior to school sampling are the same for the bridge and eTIMSS samples as they took place before the drawing of the samples. Although the within-school exclusion estimates for the bridge and eTIMSS samples could be different because the students in the two samples were not the same, in general the within-school exclusion rates estimated from the bridge samples were very similar to those estimated from the eTIMSS samples. However, because of the smaller sample sizes for the bridge, the within-school exclusion rate estimates from the eTIMSS samples are more precise than those estimated from the bridge samples. Exhibits 9.22 and 9.23 summarize population coverage and exclusions resulting from the bridge samples.

Exhibit 9.22: Bridge - Coverage for TIMSS 2019 - Fourth Grade Target Population

## Target Population Size

Exhibits 9.24 and 9.25 show the number of schools and students in each country's target population ${ }^{3}$ and bridge sample, as well as an estimate of the student population size based on the bridge sample data. The target population figures are derived from the sampling frame used to select the TIMSS 2019 samples, while the sample figures are based on the number of sampled schools and students that participated in the bridge assessments. The student population size estimated from the sample were computed using sampling weights, which are explained in more detail in Chapter 3.

## Sampling Participation for the TIMSS 2019 Bridge Samples

The bridge samples for TIMSS 2019 were subject to the same quality requirements as the TIMSS 2019 samples, as summarized in Exhibit 9.9.

Exhibits 9.26 through 9.29 present the school, classroom, student, and overall weighted and unweighted participation rates for each country's fourth and eighth grade bridge samples, respectively. At the fourth grade, all but two countries were in the same participation category for the bridge sample as for the eTIMSS samples. The Netherlands improved their rating and achieved the minimum acceptable participation rate after including replacement schools for their bridge sample and Norway met the participation requirement for their bridge sample without the use of replacement schools.

At the eighth grade, all but one country had the same participation category for the bridge sample as for the eTIMSS sample. The United States nearly met the required sampling participation rate at the eighth grade with the use of replacement for their bridge sample.

Exhibit 9.26: Bridge - Participation Rates (Weighted) - TIMSS 2019 - Fourth Grade

| Country | School Participation |  | Class <br> Participation | Student Participation | Overall Participation |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Appendix 9A: Characteristics of National Samples

## Albania

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<3$ ), special needs schools, very small schools - Grade 3, language not Albanian, and special curriculum
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (public, private), and urbanization (urban, rural) within public schools
- Implicit stratification by urbanization (urban, rural) within private school stratum
- Sampled two classrooms in large schools (measure of size > 100)

School Participation Status

$$\right)\)

## Armenia

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), and special needs schools
- Within-school exclusions consisted of non-native language speakers

## Sample Design

- Explicit stratification by region (10)
- No implicit stratification
- Sampled two classrooms in large schools (measure of size $>60$ )
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.

## Australia

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<5$ ), very remote schools, and special and non-mainstream schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by state or territory (8)
- Implicit stratification by school type (Catholic, government, independent), geographic location (metropolitan, provincial, remote), and socioeconomic index (low socioeconomic status, high socioeconomic status)
- Sampled one classroom per school. In tracked schools, classrooms were grouped according to the ability level of students prior to sampling and one classroom was sampled per class group.
- The TIMSS Grade 4 and Grade 8 samples were selected sequentially.
- The TIMSS sample at Grade 4 was selected by controlling the overlap with the PISA and the TIMSS Grade 8 samples using the Chowdhury approach
- Schools were oversampled at the state/territory level

## Austria

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by urbanization (area with more than 50,000 inhabitants, area with 50,000 inhabitants or less), achievement score (low, medium, high), and school size (small, large)
- Implicit stratification by region (9)
- Sampled two classrooms per school. In schools sampled for eTIMSS and bridge, one classroom sampled per assessment
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- Austria provided a bridge sample for their own national analyses only since they did not have a trend with TIMSS 2015
- $36.4 \%$ of students in the bridge sample were in schools selected for the eTIMSS sample

## Canada

## Fourth Grade

## Coverage and Exclusions

- Coverage is 79.3 percent. Coverage in Canada is restricted to students from the provinces of Alberta, Manitoba, Newfoundland, Ontario, and Quebec.
- School-level exclusions consisted of very small schools (measure of size $<10$ in Quebec, measure of size $<6$ in Ontario, Alberta, and Newfoundland, measure of size $<4$ in Manitoba), special needs schools, First Nation schools and federal schools. French schools, non-ministry schools and remote or hard to access schools (in Newfoundland). Home schools (in Alberta and Manitoba), not funded schools (in Manitoba). International schools and school boards with special status (in Quebec).
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by provinces (5). Within the province of Alberta, explicit stratification was done by school system (French, English), school type (public, private, separate), and by school size (small, large). Within the province of Ontario, explicit stratification was done by language (English, French), school type (private, Catholic, public), and by school size (small, large) within Catholic and public schools. Within Quebec and Manitoba, explicit stratification was done by language (French, English), school type (public, private), and school size (small with less than three classes, large with three or more classes).
- Implicit stratification by region (6) in English public and Catholic schools explicit strata within Ontario
- Sampled two classrooms in large schools (measure of size > 40 in Ontario and measure of size > 75 in Quebec). In schools sampled for eTIMSS and bridge, one classroom sampled per assessment
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- All Alberta and Manitoba French schools were selected
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS sample and classes were randomly
assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 60.3 \% of students in the bridge sample were in schools selected for the eTIMSS sample

## Chile

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<5$ ), special needs schools, and geographically inaccessible schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by ‘Grade 4'/’Grade 4 and Grade 8 ' schools, school type (public, private subsidized, private), and urbanization (rural, urban)
- Implicit stratification by national assessment score level (4)
- Sampled one classroom per school
- The Field Test and Main Data Collection TIMSS samples were selected sequentially. The TIMSS Main Data Collection sample was selected by controlling for the overlap with the TIMSS Field Test, ICILS, and PISA samples using the Chowdhury approach.
- Private schools were oversampled
- Separate samples of schools for eTIMSS and bridge were selected so there was no overlap between the samples

## Chinese Taipei

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<$ ), and schools that do not follow the national curriculum
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by urbanization (metropolitan area, city area, developing city area, rural and remote area), region (north, other), and school size (small, large)
- No implicit stratification
- Sampled two classrooms in large schools (measure of size $>290$ for eTIMSS, measure of size $>68$ for bridge). In schools sampled for eTIMSS and bridge, one classroom sampled per assessment
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 85.6 \% of students in the bridge sample were in schools selected for the eTIMSS sample

## Cyprus

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<$ ), special needs schools, Turkish Occupied Area, and language of instruction other than Greek or English
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (public, private), curriculum (national curriculum, other), and district (4)
- Implicit stratification by urbanization (urban, rural)
- Sampled three classrooms whenever possible in large schools (measure of size $>65$ )
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.

## Czech Republic

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), special needs schools, and Polish language schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (14). One additional stratum created for schools with no Grade 4 students on the frame but expected to have some during the Main Data Collection.
- No implicit stratification
- Sampled two classrooms per school
- The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- Separate samples of schools for eTIMSS and bridge were selected so there was no overlap between the samples

## Denmark

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<5$ ), and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (public, private), and school size (small, large) within public schools
- No implicit stratification
- Sampled two classrooms in large schools that participate in eTIMSS or both eTIMSS and bridge (measure of size > 85). Sampled two classrooms in large schools that participate in bridge only (measure of size >44).
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- The bridge sample was obtained using a combination of strategies. In the large school stratum, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school and private school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 37.2 \% of students in the bridge sample were in schools selected for the eTIMSS sample

## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<6$ ), special needs schools, and language schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by language (Finnish, Swedish), and major region (4) and urbanization (urban/semi-urban, rural) within Finnish schools
- Implicit stratification by regional state administrative agency (6)
- Sampled two classrooms per school
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- No bridge sample required at Grade 8 as they did not participate in TIMSS 2015

## Germany

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (regular, special needs). Within regular school, explicit stratification by socioeconomic status estimated by the percentage of migrants (low, medium, high), and school size (small, large).
- No implicit stratification
- Sampled one classroom per school. In schools sampled for eTIMSS and bridge, one classroom sampled per assessment
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 44.9 \% of students in the bridge sample were in schools selected for the eTIMSS sample

## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of special needs schools, and schools with students taught in foreign language
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by 'Grade 8 only'/'Grade 4 and Grade 8 ' schools, type of community (capital, county town, town, rural area) and national assessment score (low, medium, high) within 'Grade 4 and Grade 8' stratum
- No implicit stratification
- Sampled two classrooms per school
- Grade 4 and Grade 8 samples were selected simultaneously with maximum overlap
- The Main Data Collection school samples for Grade 4 and Grade 8 were selected by controlling for the overlap with the Field test samples using the Chowdhury approach
- Separate samples of schools for eTIMSS and bridge were selected so there was no overlap between the samples

## Israel

## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<5$ ), special needs schools, ultra Orthodox schools, and schools teaching in English or French
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school sector (3), socioeconomic status (high, medium, low), subgroups within Arab sector (Arab, Druze, Bedouin), and school size (small, large)
- Implicit stratification by gender (male, female, mixed), and region (north, south, all)
- Sampled one classroom per school in schools that are selected to do eTIMSS or Bridge only and two classes in schools that are selected to do both assessments.
- The Field Test and Main Data Collection TIMSS samples were selected sequentially. The TIMSS Main Data Collection sample was selected by controlling for the overlap with the TIMSS Field Test sample and a national study (Mitzav) using the Chowdhury approach.
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 91.2 \% of students in the bridge sample were in schools selected for the eTIMSS sample

## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<3$ ), special needs schools, Slovenian, Ladin and German language schools
- Within-school exclusions consisted of students with functional disabilities

## Sample Design

- Explicit stratification by 'Grade 8 only'/'Grade 4 and Grade 8 ' schools, school type (private, public), region (center, islands, north east, north west, and south) within Grade 4 and Grade 8 public schools
- Implicit stratification by region (center, islands, north east, north west, and south) within Grade 8 only
- Sampled two classrooms in large schools (measure of size > 135)
- Grade 4 and Grade 8 school samples were selected simultaneously with maximum overlap
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- Separate samples of schools for eTIMSS and bridge were selected so there was no overlap between the samples

## Korea, Rep. of

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<$ ), and remote schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by urbanization (3) and school size (small, large)
- No implicit stratification
- Sampled two classrooms in large schools (measure of size > 190). In schools sampled for eTIMSS and bridge, one additional classroom was selected for the bridge
- No overlap between Grade 4 and Grade 8 school samples
- The Main Data Collection school sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 82.8 \% of students in the bridge sample were in schools selected for the eTIMSS sample

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of special needs schools, and minority language schools
- Within-school exclusions consisted of students with intellectual disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by ‘Grade 4 only'/'Grade 4 and Grade 8 ' schools, school type (public, private), region (6), and gender (male, female) within public Grade 4 only schools and language (3) within private Grade 4 and Grade 8 schools
- No implicit stratification
- Sampled one classroom per school
- The Grade 4 and Grade 8 samples were selected with maximum overlap

## School Participation Status

## Latvia

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of special needs schools, other Language schools, and distance learning schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by urbanization (Riga, city, town and rural area), language (Latvian, Russian), and school type (basic-beginners, secondary) within town and rural area Latvian schools
- No implicit stratification
- Sampled two classrooms in large schools (measure of size > 85) and in schools where class grouping was applied
- Class group option was used in bilingual schools

## School Participation Status

## Lebanon

## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size < 8)
- No within-school exclusions

## Sample Design

- Explicit stratification by regions or grouped regions (6), school type (public, private), and school size (small, large)
- No implicit stratification
- Sampled one classroom per school
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- Census of schools in Beirut and Mont Liban large public school strata
- In census strata, schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates

## Lithuania

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), special needs schools, schools with students taught in a language other than Lithuanian, Polish, or Russian, and schools providing remote studying
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by ‘Grade 4 '/'Grade 4 and Grade 8 ' schools, and language (5)
- Implicit stratification by urbanization (4), and school type (4)
- Sampled two classrooms in large schools (more than 4 classes)
- Grade 4 and Grade 8 school samples were selected simultaneously with minimum overlap.
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- Separate samples of schools for eTIMSS and bridge were selected so there was no overlap between the samples

- Explicit stratification by school type (private, public) and region (12)
- Implicit stratification by urbanization (urban, rural) within public sector
- Sampled two classrooms in public schools from the region of Oued eddahab Lagouira where all schools were taken
- No overlap between Grade 4 and Grade 8 samples
- Schools at the regional level were oversampled. Census in the region of Oued eddahab Lagouira.
- In census strata, schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates

## Pakistan

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), and language of instruction other than English, Urdu or Sindhi
- No within-school exclusions

## Sample Design

- Explicit stratification by school type (public, private), region (Khyber Pakhtunkhwa, Punjab, Sindh, other small regions) within public schools and region (Punjab, other regions) within private schools
- Implicit stratification by region (5), urbanization (urban, rural) and gender (boys, girls) within public schools, and by regions (6) within private schools
- Sampled two classrooms per school
- Private schools were sampled with equal probability as no measure of size was available

## Portugal

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<$ ), special needs schools, and non Portuguese instruction language or not following national curriculum
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by school type (public, private), NUTS 2 region within public schools (8), and school size (2) within private schools
- Implicit stratification by NUTS 3 region within public schools (25) and NUTS 2 region within private schools (8)
- Sampled two classrooms in large schools (measure of size > 110). In schools sampled for eTIMSS and bridge, one additional classroom sampled for the bridge
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 87.8 \% of students in the bridge sample were in schools selected for the eTIMSS sample

## Russian Federation

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (43).
- No implicit stratification
- Sampled one classroom per school
- No overlap control between Grade 4 and Grade 8 samples.
- The Main Data Collection sample was selected by controlling for the overlap with the Moscow benchmarking sample using the Chowdhury approach
- An extra sampling stage (regions) was required prior to sampling schools. 43 regions out of 85 were selected with probability proportional to the region size. 14 bigger regions were selected with certainty. Each certainty region make up an explicit stratum. The other sampled regions make up one other large explicit stratum for variance purposes. In this latter stratum of sampled regions, a sample of schools is selected within each region.
- Within regions, schools were selected with probability proportional to (school) size systematic sampling. Schools were sorted (serpentine) by location (up to 7 levels) before being sorted by school size.
- Separate samples of schools for eTIMSS and bridge were selected so there was no overlap between the samples
- Special treatment is required for variance calculation due to the first sampling stage (region). Within each explicit stratum made up from a certainty region, schools are paired together as in the standard procedure. In the larger explicit stratum composed of sampled regions, regions are paired for variance calculation purposes.

[^7]
## Eighth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), and special needs schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (43).
- No implicit stratification
- Sampled one classroom per school
- No overlap control between Grade 4 and Grade 8 samples.
- An extra sampling stage (regions) was required prior to sampling schools. 43 regions out of 85 were selected with probability proportional to the region size. 14 bigger regions were selected with certainty. Each certainty region make up an explicit stratum. The other sampled regions make up one other large explicit stratum for variance purposes. In this latter stratum of sampled regions, a sample of schools is selected within each region.
- Within regions, schools were selected with probability proportional to (school) size systematic sampling. Schools were sorted (serpentine) by location (up to 7 levels) before being sorted by school size.
- Separate samples of schools for eTIMSS and bridge were selected so there was no overlap between the samples
- Special treatment is required for variance calculation due to the first sampling stage (region). Within each explicit stratum made up from a certainty region, schools are paired together as in the standard procedure. In the larger explicit stratum composed of sampled regions, regions are paired for variance calculation purposes.

## Slovak Republic

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<3$ ), special needs schools, instruction language other than Slovak or Hungarian, and alternative schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by language (Slovak, Hungarian), national testing score (4), and school size (small, large) within Slovak schools
- No implicit stratification
- Sampled two classrooms per school. In schools sampled for eTIMSS and bridge, one additional classroom sampled for the bridge.
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- $34.5 \%$ of students in the bridge sample were in schools selected for the eTIMSS sample

## South Africa

## Fifth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<$ ), and special needs schools
- No within-school exclusions

## Sample Design

- Explicit stratification by school type (independent, public) and province (9) within public schools
- Implicit stratification by performance level (1st quintile, 2nd quintile, 3rd quintile, 4th and 5th quintiles, missing) within public schools and province (Gauteng, Western Cape, Eastern Cape, Limpopo, all other provinces) within independent schools
- Sampled one classroom per school
- No overlap between Grade 5 and Grade 9 samples

## School Participation Status

| Total | 524 | 4 | 516 | 2 | 1 | 1 | 0 |

## Spain

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<4$ ), special needs schools, international schools outside Madrid, and geographically inaccessible or campus schools
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by region (9) and school type (public, private). Within Madrid, explicit stratification was done by school funding (publicly funded, non publicly funded) within private schools, bilingual status (bilingual, not bilingual) within publicly funded private schools and public schools
- Implicit stratification by region within the other regions strata (12) and school type (public, private) within Ceuta and Melilla strata
- Sampled one classroom per school. In schools sampled for eTIMSS and bridge, one classroom sampled per assessment. in schools selected for the bridge only, two classrooms sampled in large schools (measure of size $>45$ ).
- The Field Test and Main Data Collection TIMSS samples were selected sequentially. The TIMSS Main Data Collection sample was selected by controlling for the overlap with the TIMSS Field Test sample using the Chowdhury approach.
- Oversampled in Asturias, Castile and Leon, Catalonia, La Rioja, Ceuta, Melilla and Madrid in order to get better estimates. A census of schools was taken in the autonomous cities of Ceuta and Melilla.
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- $53 \%$ of students in the bridge sample were in schools selected for the eTIMSS sample
- In census strata, schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates

## United Arab Emirates

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of instruction language other than English or Arabic, and very small schools (measure of size $<10$ in Abu Dhabi and $<5$ in other emirates but Dubai)
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by ‘Grade 4'/'Grade 4 and Grade 8’ schools, emirate (Dubai, Abu Dhabi, all other emirates), school type (public, private), as well as by the main curriculum taught (UK/US/CAD/AUS/International, other) within private schools in all emirates with the exception of Dubai
- Implicit stratification by school size (small, large), as well as region (Abu Dhabi, Al Ain, Al Dhafra) within large private schools of Abu Dhabi, language of test (Arabic, English, French) within Dubai, emirate (Sharjah, other emirates) within public schools, and curriculum (Ministry of Education, UK/US/CAD, other) within private schools in the rest of the emirates
- Sampled two classrooms per school. In schools sampled for eTIMSS and bridge, one additional classroom was sampled for the bridge
- Grade 4 and Grade 8 school samples were selected simultaneously with maximum overlap
- The Field Test and Main Data Collection samples were selected sequentially. In areas other than Dubai, the Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.
- The United Arab Emirates was divided into three areas: Abu Dhabi, Dubai, and the rest of the emirates. All schools were sampled in Dubai. All public schools as well as all private schools with UK/US/CAD/AUS/International/SABIS curriculum were sampled in the other emirates.
- The bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 98.9 \% of students in the bridge sample were in schools selected for the eTIMSS sample
- In census strata, schools or classes were used as variance estimation strata and classes or half classes were used to build jackknife replicates

## United States

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- No school-level exclusions
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by poverty level (high, low), school type (public, private), census region (4) within public schools, and school funding (Catholic, non Catholic) within private schools
- Implicit stratification by urbanization (city, suburb, town, rural), ethnicity status (above $15 \%$ non-White students in a school, below $15 \%$ non-White students in a school), and state (52)
- Sampled two classrooms per school. In schools sampled for eTIMSS and bridge, one classroom sampled per assessment
- No overlap between Grade 4 and Grade 8 samples.
- The TIMSS Main Data Collection sample was selected by controlling for the overlap with the national NAEP sample using the Chowdhury approach
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- $90.7 \%$ of students in the bridge sample were in schools selected for the eTIMSS sample

## Sample Design

- Explicit stratification by poverty level (high, low), school type (public, private), census region (4) within public schools, and school funding (Catholic, non Catholic) within private schools
- Implicit stratification by urbanization (city, suburb, town, rural), ethnicity status (above $15 \%$ non-White students in a school, below $15 \%$ non-White students in a school), and state (52)
- Sampled two classrooms per school. In schools sampled for eTIMSS and bridge, one classroom sampled per assessment
- No overlap between Grade 4 and Grade 8 samples.
- The TIMSS Main Data Collection sample was selected by controlling for the overlap with the national NAEP sample using the Chowdhury approach
- The bridge sample was obtained using a combination of strategies. In the large school strata, the bridge sample was selected as a subset of the eTIMSS school sample and classes were randomly assigned to either the eTIMSS or bridge samples. In the small school strata, a
distinct sample of schools was selected for the bridge sample. During data collection, schools with only one class selected for both the eTIMSS and bridge samples were randomly assigned to administer either the eTIMSS or bridge assessment, and school weights were adjusted accordingly during the weighting process.
- 91.6 \% of students in the bridge sample were in schools selected for the eTIMSS sample

School Participation Status

## Ontario, Canada

## Fourth Grade

## Coverage and Exclusions

- Coverage is 100 percent
- School-level exclusions consisted of very small schools (measure of size $<6$ ), special needs schools, and remote and hard to access school
- Within-school exclusions consisted of students with intellectual disabilities, students with functional disabilities, and non-native language speakers

## Sample Design

- Explicit stratification by language (English, French), school type (private, Catholic, public), and by school size (small, large) within Catholic and public schools
- Implicit stratification by regional office (Thunder Bay, Sudbury-North Bay, London, Barrie, Ottawa, Toronto and Area)
- Sampled two classrooms in large schools (measure of size > 40)
- The Field Test and Main Data Collection samples were selected sequentially. The Main Data Collection sample was selected by controlling for the overlap with the Field Test sample using the Chowdhury approach.

## School Participation Status

## CHAPTER 10

## Reviewing the TIMSS 2019 Achievement Item Statistics

## Overview

Prior to scaling and reporting the results for an assessment, the TIMSS \& PIRLS International Study Center reviews key diagnostic statistics for each achievement item to evaluate its psychometric characteristics across the participating countries. This item-by-item, country-by-country review to detect unusual item properties or anomalous patterns plays a crucial role in the quality assurance of the achievement data. Finding a faulty item this late in the process is rare, but an uncharacteristically difficult item, or one with unusually low discriminating power, could indicate a potential problem with either translation or printing. Similarly, a human-scored constructed response item with low scoring reliability could indicate a problem in the translation of the scoring guide for a particular country. If such an item is found, the country's translation verification documents, printed booklets, and digital item archives can be examined for flaws or inaccuracies and, if necessary, the item can be removed from the international database for that country.

The TIMSS 2019 assessment cycle marked the beginning of the transition to eTIMSS—a digital version of the TIMSS assessment that was administered to students on computers and tablets. eTIMSS also included a novel section consisting of problem solving and inquiry tasks (PSIs), which were designed to capitalize on the digital environment to its fullest. About half the participating countries chose to transition to eTIMSS. eTIMSS trend countries also administered the paper version of their trend items to a sample of schools, providing a "bridge" that helped link the two test-taking modes. For TIMSS 2019, comparing the item statistics for eTIMSS and paperTIMSS was integral in identifying items that were psychometrically invariant (equivalent) under the IRT scaling.

## The TIMSS 2019 Item Review

The TIMSS \& PIRLS International Study Center computed item statistics for all achievement items in the 2019 fourth and eighth grade assessments, including both eTIMSS and paperTIMSS versions, including the eTIMSS PSIs and the paper "bridge" booklets administered in eTIMSS trend countries. TIMSS
fourth grade included 175 mathematics items and 175 science items in both paper and digital formats, 131 less difficult mathematics items in paper only, and 39 mathematics items from three PSIs and 19 science items from two PSIs. ${ }^{1}$ The fourth grade paper bridge booklets consisted of only trend items- 92 mathematics items and 111 science items. TIMSS eighth grade included 211 mathematics items and 220 science items in both paper and digital formats, plus 25 mathematics items from three PSIs and 29 science items from two PSIs. The bridge booklets consisted of 117 mathematics and 122 science trend items at the eighth grade.

In addition to evaluating the performance of each item, the TIMSS \& PIRLS International Study Center looked for any changes in the measurement properties of trend items from the 2015 assessment, and examined differences between items common to eTIMSS and the paper bridge booklets for mode effects. Item position effects were evaluated to ensure student performance remained steady throughout the assessment. Finally, using the item statistics, extensive analyses of each country's data were conducted to detect any anomalous patterns relative to previous cycles or the pool of participating countries on average.

Although reviewing item statistics took place over several months, staff at the TIMSS \& PIRLS International Study Center met for four consecutive working days in March 2020 to conduct a formal adjudication of the achievement data in preparation for IRT scaling. During these four days, decisions were made about any modifications needed to the data or if further analyses were required. The review was conducted item-by-item simultaneously for eTIMSS and paperTIMSS. Both versions of an item and its scoring guide were displayed while staff reviewed the item statistics as well as accompanying graphical displays. Country reports about translation errors, printing issues, or other technical problems were also referenced. In addition, graphical displays of item statistics were reviewed to detect any anomalous and systematic patterns in a particular country's data that may warrant further investigation.

Following item review, some National Research Coordinators from the participating countries and benchmarking entities were contacted to inquire about concerns or anomalies detected in the data. Decisions about item deletions or recodes were communicated to IEA Hamburg to make edits to the international data files.

## Item Review Statistics

The item statistics for each of the TIMSS 2019 participating countries were computed and combined to produce "item almanacs" for eTIMSS and paperTIMSS respectively. Each item almanac page included unweighted statistics for all countries that administered the particular item. The paperTIMSS item almanacs included data from paperTIMSS countries, countries participating in the fourth grade less

[^9]difficult mathematics assessment, and the bridge samples from eTIMSS trend countries were also reported with paperTIMSS countries. Exhibits 10.1 and 10.2 show actual samples of the statistics calculated for a selected response item and a constructed response item, respectively.

Exhibit 10.1: Example International Item Statistics for a TIMSS 2019 Selected Response Item

Exhibit 10.2: Example International Item Statistics for a TIMSS 2019 Constructed Response Item

For all items, regardless of format (i.e., selected response or constructed response) or administration mode, statistics included the number of students that responded in each country, the difficulty level (the percentage of students that answered the item correctly), and the discrimination index (the pointbiserial correlation between success on the item and total score). ${ }^{2}$ Also provided was an estimate of the difficulty of the item using a Rasch one-parameter IRT model. Statistics for each item were displayed alphabetically by country, together with an international average-i.e., based on all participating countries listed above the international average-and a reference average-based on a pool of countries that have participated regularly in the TIMSS assessments-for each statistic. The reference countries are shown with an asterisk next to their names. The international and reference averages of the item difficulties and item discriminations served as guides to the overall statistical properties of the items. The item review outputs also listed the benchmarking participants.

Statistics displayed for selected response items included the percentage of students that chose each response option-as well as the percentage of students that omitted or did not reach the item—and the point-biserial correlations for each response option. Statistics displayed for constructed response items (which could have 1 or 2 score points) included the percent correct and point-biserial of each score level. Constructed response item tables also provided information about the reliability with which each item was scored in each country, showing the total number of double-scored responses, the percentage of score

[^10]agreement between the scorers, and-because TIMSS has a 2-digit scoring scheme for diagnostic codingthe percentage of code agreement between scorers. Diagnostic codes between 20 and 29 are worth 2 score points, between 10 and 19 worth 1 score points, and between 70 and 79 worth 0 score points.

During item review, "not reached" responses (i.e., items toward the end of the booklet that the student did not attempt) ${ }^{3}$ were treated as "not administered" and thus did not contribute to the calculation of the item statistics. However, the percentage of students not reaching each item was reported. Omitted responses, although treated as incorrect, were tabulated separately from incorrect responses for the sake of distinguishing students who provided no form of response from students who attempted a response.

The definitions and detailed descriptions of the statistics that were calculated are given below. The statistics were calculated separately by grade and subject, and are listed in order of their appearance in the item review outputs:

- $\mathbf{N}$ : This is the number of students to whom the item was administered. Not-reached responses were not included in this count.
- DIFF: The item difficulty is the average percent correct on an item. For a 1-point item, including all selected response items, it is the percentage of students providing a fully correct response to the item. For 2-point items, it is the average percentage of points. For example, if 25 percent of students scored 2 points, 50 percent scored 1 point, and the other 25 percent scored 0 points, then the average percent correct would be 50 percent. For this statistic, not-reached responses were not included.
- DISC: The item discrimination is computed as the correlation between the response to an item and the total score on all items administered to a student. Items exhibiting good measurement properties should have a moderately positive correlation, indicating that the more able students get the item right, the less able get it wrong. For this statistic, not-reached items were not included.
- Percentages ( $\mathbf{P} \_\mathbf{A}, \mathbf{P}_{-} \mathbf{B}, \mathbf{P}_{-} \mathbf{C}, \mathbf{P}_{-} \mathbf{D}$, etc.): Available for selected-response items. Each column indicates the percentage of students choosing the particular response option for the item (e.g., $\mathrm{A}, \mathrm{B}$, C, D, etc.). Not-reached responses were excluded from the denominator.
- Percentages (P_0, P_1, and P_2): Available for constructed response items. Each column indicates the percentage of students responding at that particular score level, up to and including the maximum score level for the item. Not-reached items were excluded from the denominator.
- Percentages (P_OM): Percentage of students who, having reached the item, did not provide a response. Not reached responses were excluded from the denominator.
- Percentages (P_NR): Percentage of students who did not reach the item. This statistic is the number of students who did not reach an item as a percentage of all students who were administered that item, including those who omitted or did not reach that item.
- Point Biserials (PB_A, PB_B, PB_C, PB_D, etc.): Available for selected-response items. These columns show the point-biserial correlations between choosing each of the response options (e.g., A, B, C, D, etc.) and the total score on all of the items administered to a student. Items with good psychometric properties have moderately positive correlations for the correct option and negative correlations for the distracters (the incorrect options). Not-reached responses were not included in these calculations.
- Point Biserials (PB_0, PB_1, and PB_2): Available for constructed response items. These columns present the point-biserial correlations between the score levels on the item ( 0,1, or 2 ) and the overall score on all of the items the student was administered. For items with good measurement properties, the correlation coefficients should monotonically increase from negative to positive as the score on the item increases. Not-reached responses were not included in these calculations.
- Point Biserials (PB_OM): The point-biserial correlation between a binary variable indicating an omitted response to the item, and the total score on all items administered to a student. This correlation should be negative or near zero. Not-reached responses were not included in this statistic.
- Point Biserials (PB_NR): The point-biserial correlation between a binary variable indicating a not-reached response to the item, and the total score on all items administered to a student. This correlation should be negative or near zero.
- RDIFF: An estimate of the difficulty of an item based on a Rasch one-parameter IRT model applied to the achievement data of a given country. The difficulty estimate is expressed in the logit metric (with a positive logit indicating a difficult item) and was scaled so that the average Rasch item difficulty across all items within each country was zero.
- Reliability (N): Available for human-scored constructed response items. To provide a measure of the reliability of the scoring of the constructed response items, approximately 200 responses per item were independently scored by two scorers. This column indicates the number of responses that were double-scored for a given item in a country.
- Reliability (Score): Available for human-scored constructed response items. This column contains the percentage of agreement on the score point value ( 0,1, or 2 ) of the two-digit diagnostic codes assigned by the two independent TIMSS scorers.
- Reliability (Code): Available for human-scored constructed response items. This column contains the percentage of full agreement on the two-digit diagnostic codes assigned by the two independent TIMSS scorers.

As an aid to the reviewers, the item-review displays included a series of flags signaling the presence of one or more conditions that might indicate a problem with an item. The flags rarely indicate and
actual problem, but serve to draw attention to potential sources of concern. The following conditions were flagged:

- The item discrimination (DISC) was less than 0.10 (flag D)
- The item difficulty (DIFF) was less than 0.25 for selected response items (flag C)
- The item difficulty (DIFF) exceeded 0.95 (flag V)
- The Rasch difficulty estimate (RDIFF) for a given country showed the item either easier (flag E) or more difficult (flag H) relative to the international average for that item
- The point-biserial correlation for at least one distracter in a selected response item was positive, or the point-biserial correlations across the score levels of a constructed response item were not ordered (flag A)
- The percentage of students selecting one of the response options for a selected response item, or one of the score values for a constructed response item, was less than 10 percent (flag F)
- Scoring reliability for agreement on the score value of a constructed response item was less than 85 percent (flag R).

## Scoring Reliability for Human Scored Items

Constructed-response items comprised about half the assessment score points in TIMSS 2019, with most of them requiring human scoring, especially for paperTIMSS and the paper bridge. To ensure that the items requiring human scoring were scored reliably in all countries, the TIMSS \& PIRLS International Study Center developed detailed scoring guides for each constructed response item (that provided descriptions and examples of acceptable responses for each score point value) and provided extensive training in the application of the scoring guides. See Chapter 1 for more information on developing the scoring guides and see Chapter 6 for information on the human-scoring process.

For eTIMSS countries, the new mode of administration allowed for a substantial portion of the digital items to be machine scored, particularly in mathematics. For eTIMSS items suitable for machine scoring, the scoring guides served as the basis for developing machine scoring specifications for student responses that could be accurately applied without human judgment. Developing the machine scoring specifications involved testing each item in the eTIMSS Player, reviewing the output, and writing rules in terms of the output to classify all possible responses to a code in the item's scoring guide. The scoring unit at IEA Hamburg reviewed all specifications and provided feedback on an item-by-item basis, resulting in several rounds of revision until the rules for all items were clarified. The scoring unit at IEA Hamburg then applied the scoring rules for all machine-scored items and the data analysis team at the TIMSS \& PIRLS International Study Center independently replicated the results to validate the scoring.

The following sections describe the three ways human-scoring reliability was assessed and documented in 2019: within-country, over-time (trend), and across countries.

## Within-Country Scoring Reliability

To gather and document information about the within-country agreement among scorers for TIMSS 2019, a random sample of approximately 200 student responses per item were scored independently by two scorers. The inter-scorer agreement for each item in each country was examined as part of the item review process, with agreement below 75 percent giving cause for deleting the data for a particular country. Appendix 10A shows the average and range of the within-country percentages of score point agreement and diagnostic code agreement across all items. Exact percent agreement across items was high on average across countries- 98 percent in mathematics and 95 percent in science across both the fourth and eighth grade countries. In TIMSS 2019 there also was high agreement at the diagnostic score level, where international average percent agreement ranged from 94 percent in eighth grade science to 97 percent in mathematics at both grades.

## Trend Item Scoring Reliability Study

The TIMSS \& PIRLS International Study Center also took steps to show that the 2019 human-scored constructed response items used in TIMSS 2015 were scored in the same way in both assessments. In anticipation of this, countries that participated in TIMSS 2015 sent samples of scored student booklets from the 2015 data collections to IEA Hamburg, where they were digitally scanned and stored for later use. As a check on scoring consistency from one administration to the next, staff members working in each country on scoring the 2019 data were asked also to score these 2015 responses using the CodingExpert Software developed by IEA Hamburg. Each country scored 200 responses for each of 11 mathematics items (13 items for countries that administered less difficult mathematics) and 11 science items at the fourth grade, and for 14 mathematics items and 13 science items at the eighth grade. The average and range of scoring consistency over time can be found in Appendix 10B.

There was a very high degree of scoring consistency in TIMSS 2019. The exact agreement between the scores awarded in 2015 and those given by the 2019 scorers ranged from 91 percent in science at both grades to 97 percent in mathematics at the fourth grade, on average internationally. There was similarly high agreement in TIMSS at the diagnostic code level.

## Cross-Country Scoring Reliability Study

It also was important to document the consistency of scoring across countries. Because of the many different languages in use in TIMSS 2019, establishing the reliability of constructed response scoring across all countries was not feasible. However, the TIMSS \& PIRLS International Study Center did conduct
a cross-country study of scoring reliability among Northern Hemisphere countries that had scorers who were proficient in English. A sample of student responses was provided by the English-speaking Southern Hemisphere countries. Cross-country scoring included 200 student responses for each of 11 mathematics items ( 6 items for countries that administered less difficult mathematics) and 11 science items at the fourth grade, and for 14 mathematics items and 13 science items at the eighth grade. This same set of student responses in English was then scored independently in each country that had at least two scorers proficient in English, using IEA's CodingExpert Software. In all, scorers from 54 countries and 1 benchmarking participant at fourth grade and 35 countries and 2 benchmarking participants at the eighth grade participated in the study. Scoring for this study took place shortly after the other scoring reliability activities were completed. Making all possible comparisons among scorers gave 1,485 comparisons at fourth grade and 666 comparisons at eighth grade for each student response to each item. This resulted in more than 290,000 total comparisons at the fourth grade (200,000 for mathematics items not administered to less difficult countries) and more than 120,000 total comparisons at the eighth grade when aggregated across all 200 student responses to that item. Agreement across countries was defined in terms of the percentage of these comparisons that were in exact agreement.

Appendix 10C reports the results of the cross-country scoring reliability study. On average internationally, scorer reliability across countries in TIMSS 2019 was high. The exact agreement between the scores awarded across countries ranged from 89 percent in science to 96 percent in mathematics at the fourth grade and from 89 percent in science to 94 percent in mathematics at the eighth grade, on average internationally. There was similarly high agreement at the diagnostic code level.

## Item-by-Country Interactions

Although countries are expected to exhibit some variation in performance across items, in general countries with high average performance on the assessment should perform relatively well on each of the items, and low-scoring countries should do less well on each of the items. When this does not occur (e.g., when a high-performing country has low performance on an item on which other countries are doing well), there is said to be an item-by-country interaction. When large, such item-by-country interactions may be a sign that an item is flawed in some way and that steps should be taken to address the problem. To assist in detecting sizeable item-by-country interactions, the TIMSS \& PIRLS International Study Center produced a graphical display for each item showing the difference between each country's Rasch item difficulty and the international average Rasch item difficulty across all countries. An example of the graphical displays is provided in Exhibit 10.3.

Exhibit 10.3: Example Plot of Item-by-Country Interaction for a TIMSS 2019 Item

In each of these item-by-country interaction displays, the difference in Rasch item difficulty for each country is presented as a 95 percent confidence interval, which includes a built-in Bonferroni correction for multiple comparisons across the participating countries. The limits for this confidence interval were computed as follows:

$$
\begin{align*}
& \text { Upper Limit }=R D I F F_{i .}-R D I F F_{i k}+S E\left(R D I F F_{i k}\right) \cdot Z_{b}  \tag{10.1}\\
& \text { Lower Limit }=R D I F F_{i .}-R D I F F_{i k}-S E\left(R D I F F_{i k}\right) \cdot Z_{b} \tag{10.2}
\end{align*}
$$

where RDIFF $_{i k}$ is the Rasch difficulty of item $i$ in country $k$, RDIFF $_{i \text { i. }}$ is the international average Rasch difficulty of item $i, \operatorname{SE}\left(\mathrm{RDIFF}_{i k}\right)$ is the standard error of the Rasch difficulty of item $i$ in country $k$, and $Z_{b}$ is the 95 percent critical value from the Z distribution corrected for multiple comparisons using the Bonferroni procedure.

## Review of Item Statistics for Measuring Trends

To measure trends, TIMSS assessments include achievement items from previous assessments as well as items developed for use for the first time in 2019. Accordingly, the TIMSS 2019 assessments included items developed in 2011, 2015, and 2019. Therefore, an important review step included checking that these "trend items" had statistical properties in 2019 similar to those they had in the previous assessments (e.g., a TIMSS item that was relatively easy in 2015 should still be relatively easy in 2019).

As shown in the example in Exhibit 10.4, the trend item review focused on statistics for paper trend items from the current and previous assessments (2019 and 2015) for countries that participated in both. This included statistics for the eTIMSS bridge samples. For each country, trend item statistics included the percentage of students in each score category (or response option for selected response items) for each assessment, as well as the difficulty of the item and the percent correct by gender. In reviewing these item statistics, the aim was to detect any unusual changes in item difficulties between administrations, which might indicate a problem in using the item to measure trends.

Exhibit 10.4: Example Item Statistics in 2019 and 2015 for a TIMSS 2019 Trend Item

V1 = Percent scoring 1 pt or better; V2 = Percent scoring 2 pts;
Percent right for boys and girls corresponds to percent obtaining full credit.
Because of missing gender information, some totals may appear inconsistent.

The TIMSS \& PIRLS International Study Center used two different graphical displays to examine the differences in countries' Rasch item difficulties between 2019 and 2015. While some changes in item difficulties were anticipated, as countries' overall achievement may have improved or declined, items were noted if the difference between the Rasch difficulties across the two assessments for a particular country was greater than 2 logits.

The first of these displays, shown for an example item in Exhibit 10.5, displays the difference in Rasch item difficulty of the item between 2019 and 2015 for each country. The difference in Rasch item difficulty for each country is displayed as a confidence interval, calculated using equations (10.1) and (10.2) but using each country's 2019 and 2015 Rasch difficulties and the standard error of their difference. A positive difference for a country indicates that the item was relatively easier in 2019, and a negative difference indicates that the item was relatively more difficult.

## Exhibit 10.5: Example Plot of Differences in Rasch Item Difficulties Between 2019 and 2015 for a TIMSS 2019 Trend Item

The second graphical display, presented in Exhibit 10.6, shows the performance of a given country on all trend items simultaneously. For each country, the graph plots the 2019 Rasch difficulty of every trend item against its Rasch difficulty in 2015. When there were no differences between the difficulties in the two successive administrations, the data points aligned on or near the diagonal. Large deviations from the diagonal were noted for further investigation.

Exhibit 10.6: Example Plot of Rasch Trend Item Difficulties Across TIMSS 2019 and 2015 by Country

## Item Position Effects

As described in the TIMSS 2019 Assessment Design, assessment items for each grade and subject are arranged in 14 groups called "item blocks" (for paperTIMSS) or "item block combinations" (for eTIMSS), which were assembled into achievement booklets. Each item block appears in two booklets, with each item block appearing in the first half of one booklet and the second half of another. This counterbalancing helps to control for the impact of item position on the item statistics.

To examine the magnitude of item position effects on item percent correct and the percent of omitted and not-reached responses, block-level item statistics weighted by maximum score points were computed for each of the two positions that each block appears in the booklet design-either position 1 and position 4 or position 2 and position 3. The results are reported in Appendix 10D for each assessment averaged across countries, as well as for each country across item blocks. A summary of results with the average differences in item statistics between the booklet positions is provided in Exhibits 10.7 and 10.8 for the fourth and eighth grade, respectively.

Exhibit 10.7: Summary of International Average Item Block Statistics by Booklet Position (Weighted)—Grade 4

Exhibit 10.8: Summary of International Average Item Block Statistics by Booklet Position (Weighted)—Grade 8

|  | Average Percent Correct Across Items |  |  | Average Percent Omitted Responses Across Items |  |  | Average Percent Not Reached Across Items |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Positions } \\ & \text { 1\&3 } \end{aligned}$ | $\begin{gathered} \text { Positions } \\ 2 \& 4 \end{gathered}$ | Difference | $\begin{aligned} & \text { Positions } \\ & \text { 1\&3 } \end{aligned}$ | $\begin{array}{\|c} \text { Positions } \\ 2 \& 4 \end{array}$ | Difference | $\begin{gathered} \text { Positions } \\ 1 \& 3 \end{gathered}$ | $\begin{array}{\|c} \text { Positions } \\ 2 \& 4 \end{array}$ | Difference |
| Mathematics |  |  |  |  |  |  |  |  |  |
| eTIMSS | 44.0 | 41.9 | -2.1 | 5.5 | 7.0 | 1.5 | 0.1 | 1.8 | 1.7 |
| paperTIMSS | 34.9 | 33.2 | -1.6 | 7.9 | 8.5 | 0.7 | 0.1 | 2.0 | 1.9 |
| Science |  |  |  |  |  |  |  |  |  |
| eTIMSS | 47.8 | 46.3 | -1.5 | 4.0 | 5.0 | 1.1 | 0.1 | 0.8 | 0.7 |
| paperTIMSS | 39.6 | 38.1 | -1.5 | 6.7 | 7.5 | 0.8 | 0.1 | 1.6 | 1.6 |

The results indicate minimal impact of block position on the TIMSS 2019 item statistics. On average, item blocks appearing in the second half of a booklet part (positions 2 and 4) were slightly more difficult and had slightly more missing responses than item blocks appearing the first half of a booklet part (positions 1 and 3). However, the differences were small. Across countries, differences in average item percent correct between positions $2 / 4$ and positions $1 / 3$ ranged from -1.2 at the fourth grade for the less difficult mathematics items to -2.1 in eighth grade eTIMSS mathematics. Differences in average percent omitted ranged between 0.4 in fourth grade less difficult mathematics to 1.5 in eighth grade eTIMSS mathematics; and differences in average percent not reached ranged between 0.7 in eighth grade eTIMSS science and 4.2 in fourth grade science for less difficult countries.

## Detecting Anomalies in the TIMSS 2019 Achievement Data

To ensure that each participating country and benchmarking entity had data adhering to TIMSS' quality standards, the TIMSS \& PIRLS International Study Center conducted analyses of item statistics at the country level. Several graphical displays were produced for each TIMSS participant for item percent correct, item point-biserials, and percent omitted responses. The graphs were analyzed to detect any anomalous patterns in any particular country's data relative to the international average or to their previous TIMSS performance. Anomalous patterns may be indicative that systematic errors occur in a country's data, which may be due to errors in collecting and processing the data. For any anomalous patterns detected in the item statistics for a particular country, the National Research Coordinator was contacted to discuss how best to address any issues.

The first set of graphical displays compared each country's item performance to the international average for all items simultaneously, where item performance is defined in terms of item percent correct, item discrimination (point-biserial correlation), and item percent omitted. An example is shown in Exhibit 10.9 for item percent correct. For each country, the graph plots the 2019 item percent correct of all items against the 2019 international average. Typical patterns show data points along the range of the $x$ - and $y$ axis, with random deviations from the diagonal. There may be more points above the diagonal for higher performing countries and more points below for lower performing countries, but otherwise the points should align closely with the diagonal. The best-fit line should be approximately linear and parallel with the diagonal. Any patterns largely deviating from this were noted for further investigation. Plots comparing national and international item discrimination (point-biserial correlation) and percent omitted should have similar patterns, but points more tightly clustered together since there is a smaller range.

These plots of national versus international item statistics were also compared against the same plots produced in TIMSS 2015. If the patterns for both assessments were unusually different, it may indicate a problem in the 2019 data. The plots may also be examined separately for selected response and
constructed response formatted items to ensure similar patterns. The relationship between national and international statistics for both item types should also match that from TIMSS 2015.

Exhibit 10.9: Example Plot of Item Percent Correct Across National and International by Country

The second set of graphical displays compares each country's TIMSS 2019 trend item performance with their TIMSS 2015 item performance for all items simultaneously, where item performance is defined in terms of percent correct, item discrimination (point-biserial correlation), and item percent omitted. An example is shown in Exhibit 10.10 for item percent omitted, displaying a typical pattern. For each country, the graphs plots the 2019 item percent omitted of every trend item against its item percent omitted in 2015, with points colored according to item type. When there were no differences between the difficulties in the two successive administrations, the data points aligned on or near the diagonal from the graph origin. While some changes were anticipated, as countries' overall achievement may have improved or declined, unusually large deviations from the diagonal were noted for further investigation. For all statistics plotted, comparisons should show similar patterns for both selected response and constructed response item types, and any differences should not relate to the difficulty of the item.

An additional set of plots were produced comparing each country's TIMSS 2019 item performance with their item performance from the field test conducted one year earlier. These plots were similar to the example in Exhibit 10.10 below comparing 2019 and 2015 performance, with the expectation of smaller differences. Large differences in item performance compared to the field test would be considered a implausible change in performance, warranting further review.

Exhibit 10.10: Example Plot of Item Percent Omitted Across TIMSS 2019 and 2015 by Country

## Item Review Outcomes

Using all the information from the comprehensive collection of item analyses and reliability data that were computed and summarized for TIMSS 2019, the TIMSS \& PIRLS International Study Center thoroughly reviewed all item statistics for every participating country and benchmarking participant to ensure that the items were performing comparably across countries and modes. In particular, items with the following problems were considered for possible deletion from the international database:

- An error was detected for a particular country during translation verification but was not corrected before test administration
- Data checking revealed a selected response item with more or fewer options than in the international version for a particular country
- The item analysis showed the item to have a negative biserial, or, for an item with more than 1 score point, point-biserials that did not increase with each score level
- For selected response items, the item review revealed a faulty distracter influencing the item statistics for all countries
- The item-by-country interaction results showed a very large negative interaction for a particular country
- For constructed response items, the within-country scoring reliability data showed an agreement of less than 75 percent
- For trend items, an item performed substantially differently in 2019 compared to the TIMSS 2015 administration, or an item was not included in the previous assessment for a particular country
- For eTIMSS trend items, a substantially larger than average difference in item difficulty or percent omitted between eTIMSS and bridge for a particular country.

When the item statistics indicated a problem with an item, the documentation from the translation verification was used as an aid in checking the test booklets. If a question remained about potential translation or cultural issues, however, then the National Research Coordinator was consulted before deciding how the item should be treated.

The checking of the TIMSS 2019 achievement data involved review of more than 1,800 items and resulted in the detection of very few items that were inappropriate for international comparisons. Among the few items singled out in the review process were mostly items with differences attributable to either translation or printing problems. A small number of items were identified as having severe differential item functioning after item review during IRT scaling. Diagnostic score codes for some constructed
response items may be recoded if the point-biserials did not behave. Decisions about deleting items for all countries were most often implemented for both eTIMSS and paperTIMSS versions, with a few exceptions.

Appendix 10E includes a list of deleted items, as well as a list of recodes made to constructed response items. There also were a number of items in each study that were combined, or derived, for scoring purposes. See Appendix 10F for details about how score points were awarded for each derived item.

## Review of Item Statistics Between eTIMSS and paperTIMSS

To establish a link between eTIMSS and paperTIMSS, eTIMSS countries that also participated in TIMSS 2015 administered paper booklets of trend items to randomly equivalent "bridge" samples of students. To strengthen the link, an important review step for TIMSS 2019 included checking the extent that items had similar statistical properties between eTIMSS and paperTIMSS (e.g., an item that was relatively easy on paper should also be easy in digital format).

The review focused on eTIMSS item percent correct statistics for trend items administered in digital format to the regular sample of students compared to those in paper format for the bridge samples (see Exhibit 10.11 for an example of this type of item almanac). For each eTIMSS country, mode difference item statistics included the percentage of students in each score category (or response option for selected response items) for each assessment, as well as the difficulty of the item and the percent correct by gender. In reviewing these item statistics, the aim was to identify items that were likely to be found invariant under IRT, as well as to detect any unusual differences in item difficulties between modes for a particular country that might indicate a problem. Further item equivalence analyses performed during scaling are described in Chapter 12 of this volume.

DIFF $=$ Percent correct
Because of missing gender information, some totals may appear inconsistent.

Two different graphical displays were produced for item review to assess the differences in item difficulty by mode of administration. Exhibit 10.12 shows the first of these for an example item. For each country, the difference in item percent correct between eTIMSS and bridge is displayed as a confidence interval. This was calculated using equations (10.1) and (10.2), but using each country's 2019 bridge and eTIMSS percent correct values and the standard error of their difference. A positive difference for a country indicates that the item was relatively harder in eTIMSS, and a negative difference indicates that the item was relatively easier.

## Exhibit 10.12: Example Plot of Differences in Item Percent Correct Between eTIMSS and paperTIMSS (Bridge) for a TIMSS 2019 Trend Item

The second graphical display, presented in Exhibit 10.13, shows the mode differences in percent correct for a given country on all items simultaneously. The blue horizontal line represents the country's average difference across all the items. Where there were no differences between the percent correct in the two modes, the data points aligned on or near the horizontal axis. A positive difference for an item indicates that it was relatively easier on paper, and a negative difference indicates that the item was relatively easier in eTIMSS. Any large or systematics deviations were flagged for further review.

## Appendix 10E: Modifications to the TIMSS 2019 Achievement Data

## Grade 4 Mathematics

| Items Deleted for All Countries |
| :--- |
| M02_10B - ME71217B, MP71217B (severe differential item functioning) |
| M04_10A - ME71135A, MP71135A (severe differential item functioning) |
| M08_09 - ME71199, M08_08 - MP71199 (severe differential item functioning) |
| M10_01 - ME71005, MP71005 (severe differential item functioning) |
| Items Recoded for All Countries |
| M05_12 - ME51080, MP51080 (20 to 10, 10 to 71, 11 to 72) |
| M10_11 - ME71189, MP71189 (20 to 10, 10 to 79, 11 to 79) |
| M12_11 - ME71190, M12_10 - MP71190 (20 to 10, 10 to 70) |
| M13_02 - ME61254, MP61254 (20 to 10, 10 to 70) |
| M13_08 - ME61224, MP61224 (70 to 12) |
| M14_09 - ME71177, MP71177 (20 to 10, 10 to 70) |
| Items Deleted by Country |
| Chile |
| M05_12 - ME51080 (poor discrimination) |

## Croatia

M12_03 - ME71062 (negative discrimination)

## Hungary

M12_03 - ME71062 (negative discrimination)

```
Japan
M08_12 - MP71194 (translation error)
M12_04B - MP71216B (translation error)
M12_10 - MP71202 (translation error)
```

## Korea

```
M11_01 - ME61178, MP61178 (severe item-by-country interaction)
```

## Netherlands

M10_08 - ME71179 (derived item, poor discrimination)

[^11]
## Grade 4 Mathematics - Less Difficult

Items Deleted for All Countries
MP02_10B - MP71217B (severe differential item functioning)
MP08_08 - MP71199 (severe differential item functioning)
Items Recoded for All Countries

| MP13_02 - MP61254 (20 to 10, 10 to 70) |
| :--- |
| MP13_08 - MP61224 (70 to 12) |
| Items Deleted by Country |
| Bosnia and Herzegovina (Cyrillic language only) |
| MP13_03, MP61244 (translation error) |
| Morocco |
| MN11_09 - MN11158 (poor reliability) |

## Saudi Arabia

MP13_01 - MP61240 (derived item, translation error)
Items beginning with "MP" are items shared with the regular fourth grade mathematics assessment. Items beginning with "MN" are items unique to less difficult mathematics.

Grade 4 Science

| Items Deleted for All Countries |

S04_08B - SP72141B (low reliability)
S06_04A - SP62098A (low reliability)
South Africa, including Gauteng and Western Cape
S06_05 - SP62032 (poor discrimination)
Items beginning with "SE" are eTIMSS items. Items beginning with "SP" are paperTIMSS items, or bridge items. paperTIMSS trend items deleted or recoded for all countries were also modified for eTIMSS bridge samples.

## Appendix 10F: Derived Items in TIMSS 2019

## Grade 4 Mathematics

M01_01-ME51043: Item parts A, B, C, D, E, F, G, and H are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M01_05 - ME51508: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct

M02_03-ME71167: Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M02_05 - ME71162, MP71162: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts are correct and 1 score point is awarded if 1 part is correct
M02_06 - ME71078: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M02_08-ME71151, MP71151: Item parts A, B, and C are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 2 parts are correct
M02_11 - ME71142: Item parts $A$ and $B$ are combined to create a 1-point item, where 1 score point is awarded if both parts are correct
M02_12 - ME71204, MP71024: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M04_03 - ME71036, MP71036: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct

M04_09 - ME71178, MP71178: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M04_12 - ME71175, MP71175: Item parts A, B, and C are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 1 or 2 are correct
M06_01-ME61018, MP61018: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M06_10-ME61266: Item parts A, B, C, D, E, and F are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 5 parts are correct
M08_11 - ME71141, M08_10 - MP71141: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M08_12 - ME71194: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct
M08_13 - ME71193, M08_12 - MP71193: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both are correct and 1 score point is awarded if 1 part is correct
M10_05-ME71213: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M10_08-ME71179, MP71179: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M10_12A - ME71187A: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

## Grade 4 Mathematics (continued)

M11_08-ME61095: Item parts B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)
M12_04A - ME71216A, MP71216A: Item parts $A$ and $B$ are combined to create a 1-point item, where 1 score point is awarded if both parts are correct

M12_05-ME71117: Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M12_10 - ME71202: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M13_01 - ME61240, MP61240: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M13_02 - ME61254: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M14_11A - ME71138A, MP71128A: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M14_13 - ME71205, MP71205: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
Items beginning with "ME" are eTIMSS items. Items beginning with "MP" are paperTIMSS items, or bridge items. paperTIMSS trend items deleted or recoded for all countries were also derived for eTIMSS bridge samples.

## Grade 4 Mathematics - Less Difficult

MN04_14-MN21003: Item parts A, B, C, and D are combined to create a 2-point item, where 2 score points are awarded if all parts correct and 1 score point is awarded if 3 parts are correct
MN14_10 - MN21057: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

MP02_05-MP71162: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts are correct and 1 score point is awarded if 1 part is correct

MP02_08 - MP71151: Item parts A, B, and C are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 2 parts are correct
MP02_12 - MP71024: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

MP08_10 - MP71141: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
MP08_12 - MP71193: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both are correct and 1 score point is awarded if 1 part is correct

MP13_01 - MP61240: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

Items beginning with "MP" are items shared with the regular fourth grade mathematics assessment. Items beginning with "MN" are items unique to less difficult mathematics.

## Grade 4 Science

S02_03-SE71017, SP71017: Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S04_02-SE71902, SP71902: Item parts B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)

S04_04-SE71041, SP71041: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts are correct and 1 score point is awarded if 1 part is correct
S04_05-SE71046, SP71046: Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S05_10-SE51151: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S06_06 - SE61083, SP61083: Item parts B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)
S06_09A - SE61142A, SP61142A: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S07_03 - SE51138Z, SP51138Z: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct (part C was deleted)
S09_08-SE61160: Item parts B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)
S10_01 - SE71009, SP71009: Item parts A, B, C, D, E, and F are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 4 or 5 parts are correct

S10_09 - SE71106, SP71006: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S10_13-SE71254: Item parts A, B, C, D, E, F, G, and H are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S13_11-SE61124, SP61124: Item parts B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part $A$ is an example)
S13_12 - SE61116, SP61116: Item parts B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)

S14_01 - SE71063: Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S14_08-SE71114: Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

Items beginning with "SE" are eTIMSS items. Items beginning with "SP" are paperTIMSS items, or bridge items. paperTIMSS trend items deleted or recoded for all countries were also derived for eTIMSS bridge samples.

## Grade 8 Mathematics

M02_01 - ME72007, MP72007: Item parts A, B, C, D, and E are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 4 parts are correct
M02_11 - ME72180: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M02_12-ME72198, MP72198: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct
M02_14-ME72170: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M03_10 - ME62244: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct

M04_01-ME72178: Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M04_03-ME72020: Item parts A, B, C, and D are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 3 parts are correct

M04_05-ME72052, MP72052: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct
M04_11-ME72164, MP72164: Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M05_12-ME52502: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M06_10 - ME62288: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts are correct and 1 score point is awarded if 1 part is correct

M07_08 - ME52087: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts are correct and 1 score point is awarded if 1 part is correct

M08_04-ME72055: Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M09_06-ME62317: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

M09_12A - ME62345A: Item parts A, B, C, and D are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 2 or 3 parts are correct
M10_09 - ME72095, MP72095: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct,
M10_14 - ME72232, MP72232: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M11_03 - ME62215: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both are correct and 1 score point is awarded if 1 part is correct
M12_08 - ME72225, MP72225: Item parts A and B are combined to create a 1-point item, where 1 score point is awarded if both parts are correct

M13_09 - ME62170: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both parts are correct and 1 score point is awarded if 1 part is correct

## Grade 8 Mathematics (continued)

M14_09-ME72081: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
M14_10 - ME72140, MP72140: Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

Items beginning with "ME" are eTIMSS items. Items beginning with "MP" are paperTIMSS items, or bridge items. paperTIMSS trend items deleted or recoded for all countries were also derived for eTIMSS bridge samples.

## Grade 8 Science

S01_05 - SE52095Z, SP52095Z: Item parts B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part A is an example)
S02_08-SE72130, SP72130: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S02_11 - SE72232, SP72232: Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S04_02-SE72403: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S04_13-SE72345, SP72345: Item parts A, B, C, D, E, F, and G are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 5 or 6 parts are correct

S06_13A - SE62173A, SP62173A: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S07_05-SE52015Z, SP52015Z: Item parts A, B, C, D, E, and F are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S08_02 - SE72400: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S08_13-SE72260: Item parts A, B, C, D, E, F, and G are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S08_14-SE72265, SP72265: Item parts A, B, C, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S09_08-SE62018, SP62018: Item parts A, B, C, D, and E are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 4 parts are correct

S11_15 - SE62242, SP62242: Item parts A, B, D, and E are combined to create a 1-point item, where 1 score point is awarded if all parts are correct (part C was deleted)

## Grade 8 Science (continued)

S12_03-SE72000: Item parts A, B, C, D, and E are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 4 parts are correct
S12_08 - SE72143: Item parts $A, B, C$, and $D$ are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S13_04-SE62101: Item parts A, B, C, and D are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 2 or 3 parts are correct
S13_07-SE62047, SP62047: Item parts A, B, and C are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S13_08 - SE62042: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct

S13_14-SE62022, SP62022: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S13_15-SE62243: Item parts A, B, C, and D are combined to create a 2-point item, where 2 score points are awarded if all parts are correct and 1 score point is awarded if 2 or 3 parts are correct

S14_02-SE72905: Item parts A, B, C, and D are combined to create a 1-point item, where 1 score point is awarded if all parts are correct
S14_04-SE72016, SP72016: Item parts A and B are combined to create a 2-point item, where 2 score points are awarded if both are correct and 1 score point is awarded if 1 part is correct
Items beginning with "SE" are eTIMSS items. Items beginning with "SP" are paperTIMSS items, or bridge items. paperTIMSS trend items deleted or recoded for all countries were also derived for eTIMSS bridge samples.

## CHAPTER 11

# TIMSS 2019 Scaling Methodology: Item Response Theory, Population Models, and Linking Across Modes 

Matthias von Davier

## Introduction

This chapter ${ }^{1}$ describes the statistical and psychometric approaches underlying the analysis of the TIMSS 2019 data. The first part of the chapter reviews Item Response Theory (IRT), a methodology frequently used in educational measurement that is also increasingly common in other applications of quantitative analysis of human response data such as patient reported outcomes, consumer choice, and other domains. Building on these foundations, the challenges introduced by a hybrid assessment database consisting of both computer-based and paper-based country data are addressed. In TIMSS 2019, half of the countries administered the computer-based version of TIMSS (known as eTIMSS) while the other half continued to assess the students using the paper-based version (paperTIMSS).

The second part of the chapter describes an extension of IRT that allows controlling for mode of administration effects on student performance and that produces a latent variable scale representing student proficiency that is comparable across paper- and computer-based assessment.

The third part of this chapter reviews the integration of achievement data from the TIMSS 2019 mathematics and science items with contextual data from student questionnaires (and parent questionnaires at the fourth grade), and describes the statistical imputation model used for this purpose. This model is a combination of IRT approaches and a regression-based approach that utilizes the context data as predictors for the derivation of a prior distribution of proficiency, and is essentially the approach adopted by TIMSS since the first assessment in 1995. All three parts provide references and information for further reading as well as information about where in other chapters of this volume these developments are being described in terms of actual application to TIMSS 2019 data.

[^12]
## Modern Test Theory: Item Response Theory

Item Response Theory (IRT; Lord \& Novick, 1968) has become one of the most important tools of educational measurement as it provides a flexible framework for estimating proficiency scores from students' responses to test items. A Google search for the phrase "Item Response Theory" (IRT) produces 1,740,000 hits as of September 15, 2020.

TIMSS has been using IRT from the first round in 1995, initially in the form of the Rasch IRT model (Rasch, 1960; von Davier, 2016) and started to use more general IRT models (Lord \& Novick, 1968) for the production of proficiency scores beginning with the 1999 cycle. An overview of recent applications of IRT in IEA studies was given by von Davier, Gonzalez, and Schulz (2020).

One of the major goals and design principles of TIMSS, but also other large-scale surveys of student achievement, is to provide valid comparisons across student populations based on broad coverage of the achievement domain. In mathematics as well as in science, this translates into several hundred achievement items, only a fraction of which can be administered to any one student given the available testing time ( 72 minutes at fourth grade, 90 minutes at eighth grade). Therefore, TIMSS uses an assessment design based on multi-matrix sampling or balanced incomplete block designs (e.g., Mislevy, Beaton, Kaplan, \& Sheehan, 1992). As described in the TIMSS 2019 Assessment Design (Martin, Mullis, \& Foy, 2017), these achievement items are arranged in blocks that are then assembled into student booklets (or booklet equivalents for eTIMSS) that contain different (but systematically overlapping) sets of item blocks. Because each student receives only a fraction of the achievement items, statistical and psychometric methods are required to link these different booklets together so that student proficiency can be reported on a comparable numerical scale even though no student sees and answers all tasks.

IRT is particularly well suited to handle such data collection design in which not all students are tested with all items. The assumptions made for enabling IRT methods to handle these types of designs, commonly known as balanced incomplete block designs (e.g. von Davier, Sinharay, Oranje \& Beaton, 2006; von Davier \& Sinharay, 2013) can be described and tested formally (e.g. Fischer, 1981; Zermelo, 1929).

In terms of mathematical notation used in this chapter, the item response variables on an assessment are denoted by $x_{i}$ for items $i=1, \ldots, I$. The set of responses to these items is $\left(\boldsymbol{x}_{\boldsymbol{v}}\right)=\left(x_{v 1}, \ldots, x_{v i}\right)$ for student $v$. For simplicity, we assume $x_{v i}=1$ denotes a correct response and $x_{v i}=0$ denotes an incorrect response.

The achievement is assumed to be a function of an underlying latent proficiency variable, often in IRT denoted by $\theta_{v}$, a real valued variable. Then, we can write

$$
\begin{equation*}
P\left(\boldsymbol{x}_{v} \mid \theta_{v}\right)=\prod_{i=1}^{I} P\left(x_{v i} \mid \theta_{v} ; \zeta_{i}\right) \tag{11.1}
\end{equation*}
$$

where $P\left(x_{v i} \mid \theta_{v} ; \zeta_{i}\right)$ represents the probability of an either correct or incorrect response of a respondent with ability $\theta_{v}$ and an item with a certain characteristic $\boldsymbol{\zeta}_{i}$. In IRT, these item specific effects are referred to as item parameters. Equation (11.1) is a statistical model describing the probability of a set of observed response given ability $\theta_{v}$. This collective probability is the product of the individual item probabilities.

In TIMSS, the item-level probability model, $P\left(x_{v i} \mid \theta_{v} ; \boldsymbol{\zeta}_{i}\right)$, is given by an IRT model that provides a formal mathematical description, an item function, that describes how the probability of a correct response depends on the ability and the item parameters. One simple approach for an item function is the inverse of the logistic function, also sometimes called the sigmoid function depicted in Exhibit 11.1.

## Exhibit 11.1: Sigmoid Function of the Rasch Model

Sigmoid function of the Rasch model $P(x=1)=\exp (T) /[1+\exp (T)]$, where $T=a(\theta-b)$ can be used to linearly adjust for item characteristics.

Many IRT models used in educational measurement can be understood as relatively straightforward generalizations of the approach shown in Exhibit 11.1. For $a=1$, where all assessment items contribute equally to the latent construct, this model is called the Rasch model (Rasch, 1960; von Davier, 2016). Why this and other more general approaches of IRT used in TIMSS are suitable choices for modeling assessment data can be seen in the following example.

When looking at test performance by age (a proxy of ability maturation along developmental stages), Thurstone (1925) found that the proportion of respondents who successfully master different tasks is monotonically related to age. Exhibit 11.2 shows this relationship.

## Exhibit 11.2: Relationship between Age and Success on Tasks

Fig. 5.
Trace lines obtained by plotting percent correct against age from a series of tasks
(Figure 5. in Thurstone, 1925).

The similarity to the sigmoid shown in Exhibit 11.1 is obvious. When, instead of developmental age, the total number of correct responses on a longer test is used, similar graphs are obtained (Lord, 1980). Natural choices for a parametric function that can fit these types of non-linear relationships with a lower and an upper asymptote of zero and one, respectively, are the probit and the logit (e.g., Cramer, 2003).

While the Rasch model specifies a single item parameter $b_{i}$ in the form of a negative intercept, more general IRT models can be defined that allow for variation of the trace lines in terms of slopes and asymptotes. TIMSS used the Rasch model in 1995, and since 1999 uses the three-parameter logistic (3PL) IRT model (Lord \& Novick, 1968) for multiple-choice items, the 2PL IRT model for constructed response items worth 1 score point, and the generalized partial credit model (Muraki, 1992) for constructed response items worth up to 2 score points (Yamamoto \& Kulick, 2000).

The 3PL IRT model is given by

$$
\begin{equation*}
P\left(x=1 \mid \theta_{v} ; \zeta_{i}\right)=c_{i}+\left(1-c_{i}\right) \frac{\exp \left(a_{i}\left(\theta_{v}-b_{i}\right)\right)}{1+\exp \left(a_{i}\left(\theta_{v}-b_{i}\right)\right)} \tag{11.2}
\end{equation*}
$$

and is a popular choice for binary scored multiple-choice items. In equation (11.2), $c_{i}$ denotes the pseudo guessing parameter-which, when set to 0.0 , yields the 2PL for 1-point constructed response items- $b_{i}$ denotes the item difficulty parameter, and $a_{i}$ is the slope parameter.

A model frequently used for binary and polytomous ordinal items (items worth up to 2 points in TIMSS) is the generalized partial credit model (Muraki, 1992), given by

$$
\begin{equation*}
P_{i}\left(x \mid \theta_{v}\right)=\frac{\exp \left(a_{i}\left(x \theta_{v}-b_{i x}\right)\right)}{1+\sum_{z=1}^{m_{i}} \exp \left(a_{i}\left(z \theta_{v}-b_{i z}\right)\right)} \tag{11.3}
\end{equation*}
$$

assuming a response variable with $m_{i}+1$ ordered categories. Very often, the threshold parameters are split into a location and normalized step parameters, $b_{i x}=\delta_{i}-\tau_{i x}$, with $\sum_{x} \tau_{i x}=0$.

The proficiency variable $\theta_{v}$ is sometimes assumed to be normally distributed, that is, $\theta_{v} \sim N(\mu, \sigma)$. In TIMSS, a normal distribution is used to obtain initial proficiency estimates, as the 3PL model requires constraints of this and other types for identification (Haberman, 2005; San Martín, González, \& Tuerlinckx, 2015; von Davier, 2009). Subsequently, this normality constraint can be relaxed and other types of distributions utilized (Haberman, von Davier \& Lee, 2008; von Davier \& Sinharay, 2013; von Davier et al. 2006; von Davier \& Yamamoto, 2004; Xu \& von Davier, 2008a).

When there is more than one ability, for example mathematics and science, or content and cognitive process subscales of these, these are represented in a $d$-dimensional vector $\boldsymbol{\theta}_{v}=\left(\theta_{v 1}, \ldots, \theta_{v d}\right)$. In this case, one may assume a multivariate normal distribution, $\boldsymbol{\theta}_{v} \sim N(\boldsymbol{\mu}, \Sigma)$ For the IRT models used in TIMSS, these $d$-dimensions, examples are main domains or subscales, are assumed to be measured by separate sets of items, so that

$$
\boldsymbol{x}_{v}=\left(\left(x_{v 11}, \ldots, x_{v I_{1} 1}\right), \ldots,\left(x_{v 1 d}, \ldots, x_{v I_{d} d}\right)\right)
$$

represents $d$ sets of $I_{1}$ to $I_{d}$ responses, respectively. A $d$-dimensional version of the model in (11.1) is given by

$$
\begin{equation*}
P\left(\boldsymbol{x}_{\boldsymbol{v}} \mid \boldsymbol{\theta}_{v}\right)=\prod_{k=1}^{d} \prod_{i=1}^{I_{k}} P\left(x_{v i k} \mid \theta_{v k} ; \zeta_{i k}\right) \tag{11.4}
\end{equation*}
$$

with item-level IRT models (11.2) or (11.3) plugged in for $P\left(x_{v i k} \mid \theta_{v k} ; \zeta_{i k}\right)$ as appropriate. The model given in (11.4) is a multidimensional IRT model for items that show between-item multidimensionality (Adams, Wilson, \& Wu, 1997; Adams \& Wu, 2007).

## Central Assumptions of IRT Models

This section reviews important assumptions of the IRT modeling approach that are central to the types of inferences to be made in TIMSS and other international large-scale assessments. When met, these assumptions allow users of the data to make valid inferences regarding student proficiency in subject
domains such as mathematics and science. They ensure that proficiency estimates are comparable across participating countries and over time, and generalizable within the assessment domains described in the framework beyond the limited sample of items each student received.

IRT models describe the probability of a correct response, given examinees proficiency and some item-specific parameters (such as the $a_{i}, b_{i}$ described above). This, however, is not how IRT models are actually applied. Not only the item parameters but also the proficiency $\theta$ are unknowns that have to be estimated from the data, and all that analysts can rely on is a series of scored answers to a modest number of assessment items. What is needed, and what IRT provides for TIMSS, is a formal model that applies to an assessment domain as a whole, which is delineated in an assessment framework that describes the types of performances on topics viewed as representing the domain. The assumptions underlying IRT facilitate this goal in that they allow inferences about proficiency domains by providing a basis for proficiency estimates that depend on performance on assessment tasks in a well specified and scientifically testable way.

## Unidimensionality

TIMSS assesses student achievement on several items students receive. Let $I$ denote the number of items and let the response variables be denoted by $x=\left(x_{1}, \ldots, x_{I}\right)$. Unidimensionality means that a single quantity is sufficient to describe the probabilities of these responses to each of the items, and that this quantity is the same regardless of the selection of items a student received from within an assessment domain.

Denote $P_{i v}$ and $P_{j v}$ as the probability of person $v$ scoring 1 on items $i$ and $j$.

$$
P_{i v}=P_{i}\left(X=1 \mid \theta_{v}\right)
$$

and

$$
P_{j v}=P_{j}\left(X=1 \mid \theta_{v}\right)
$$

with the same real valued $\theta_{v}$ in each expression. Unidimensionality ensures that the same underlying proficiency is measured by all the test items in the domain. This of course holds only if the assessment development aims at producing a set of items that are indeed designed to assess the same assessment domain and that test developers diligently refer to the content specifications outlined in the assessment framework. Unidimensionality would (very likely) not hold, for example, if half of the items in a skills test consisted of multiplication problems, and the other half were assessing gross motor skills such as success on a soccer penalty kick practice. As these are two seemingly unrelated skills, one would likely need two proficiency scales: Multiplication proficiency and Penalty kick proficiency. However, if domains are closely
related, requiring for example different mathematical operations such as multiplication and addition, it is typically possible to report these appropriately using only one underlying proficiency variable.

## Local Independence and Population Independence

The assumption of population independence states that the probabilities of producing a correct response for a given level of proficiency are not dependent on the group to which a test taker belongs. In TIMSS, this independence is important for inferences across countries, but also within countries for inferences across different student groups. Formally population independence holds if

$$
P\left(X_{i}=x_{i} \mid \theta, g\right)=P\left(X_{i}=x_{i} \mid \theta\right)
$$

for any contextual variable $g$. This also holds for groups defined by performance on $x_{j}$ on items $j<i$ that precede the current item response $x_{i}$. The response to a preceding item can be considered a grouping variable as well, as it splits the sample into those that produced a correct response and those who did not, in the simplest case. Applying the assumption of population independence, this yields

$$
\begin{equation*}
P\left(x_{i}, x_{j} \mid \theta\right)=P\left(x_{i} \mid x_{j}, \theta\right) P\left(x_{j} \mid \theta\right)=P\left(x_{i} \mid \theta\right) P\left(x_{j} \mid \theta\right) . \tag{11.5}
\end{equation*}
$$

The assumption of local independence directly follows. It states that the joint probability of observing a series of responses, given an examinees' proficiency level $\theta$, can be written as the product of the item level probabilities. For a set of responses, local independence takes the form

$$
\begin{equation*}
P\left(\mathbf{X}=x_{1}, \ldots, x_{I} \mid \theta\right)=\prod_{i=1}^{I} P_{i}(X=1 \mid \theta)^{x_{i}}\left[1-P_{i}(X=1 \mid \theta)\right]^{1-x_{i}} \tag{11.6}
\end{equation*}
$$

While this assumption appears to be a rather technical one, it can be made more understandable by the following considerations. The proficiency variable intended to be measured is not directly observable, so one can only make inferences about it from observable response behaviors that are assumed to relate to this variable. The assumption of population invariance and local independence facilitates these inferences, in that it is assumed that once a respondent's proficiency level is accounted for, responses become independent from each other, and also from other variables. That is, knowing whether or not a respondent taking a test has answered the previous question correctly does not help predicting the next response, if the respondent's proficiency level $\theta$ is known.

According to the assumption of population invariance and local independence, if the model fits the data (and, for example, no learning occurs) and only one single proficiency is 'responsible' for the probability of giving correct responses, then no other variables (including language of the assessment,
citizenship, gender, and other contextual variables) are helpful in predicting a respondent's answer to the next item. In this sense, the assumption of local independence and population invariance encapsulate the goal that there is only one variable that needs to be considered, and that estimates of this variable will fully represent the available information about proficiency.

## Monotonicity of Item-Proficiency Regressions

One important assumption of IRT models used for achievement data is the (strict) monotonicity of item functions. As seen in Exhibit 11.1, the Rasch model (but also the 2PL and 3PL IRT models) assumes that the probability of a correct response increases with an increasing proficiency. This is represented in the following inequality:

$$
P\left(X_{i}=1 \mid \theta_{v}\right)<P\left(X_{i}=1 \mid \theta_{w}\right) \leftrightarrow \theta_{v}<\theta_{w}
$$

for all items $i$. This assumption ensures that the proficiency 'orders' the success on the items the students receive, and implies that students with a higher level on the proficiency will also have a higher probability of success on each of the items in the achievement domain. By implication, there is also a strict monotonic relationship between the expected achievement scores and proficiency $\theta$ :

$$
\begin{equation*}
E\left(S \mid \theta_{v}\right)=\sum_{i=1}^{I} P\left(X_{i}=1 \mid \theta_{v}\right)<E\left(S \mid \theta_{w}\right)=\sum_{i=1}^{I} P\left(X_{i}=1 \mid \theta_{w}\right) \leftrightarrow \theta_{v}<\theta_{w} \tag{11.7}
\end{equation*}
$$

The equation above shows that a person with a greater skill level $\theta_{w}$ compared to a lesser skill level $\theta_{\nu}$ will in terms of expected score $E\left(S \mid \theta_{w}\right)$ obtain a larger number of correct responses. This monotonicity ensures that the items and test takers are ordered as one would expect, namely that higher levels on the proficiency are associated with higher expected achievement-a larger expected number of observed correct responses-for any given item or item block measuring the same domain in an assessment booklet.

While the assumptions described above lay the foundation for IRT (and more generally, a large number of latent variable models), each of these assumptions can be relaxed to account for specific attributes of the data collection or assessment design. Models that have been described in this chapter are suitable for achievement data, and the same or variations of these models are used for the analysis of questionnaire data (as described in Chapter 16).

Specialized variants of the IRT models described here are used for reporting on an achievement domain when many different test forms are used, as well as when additional factors have to be accounted for. One such example is the transition from paper- to computer-based assessment. In the context of TIMSS 2019, the move from paper-based to computer-based administration and the need to accommodate
both administration modes in estimating student proficiency requires statistically sound extensions of IRT models. The next section describes such psychometric tools that can be applied to enable the transition to computer-based testing.

## Accounting for Mode of Administration Effects

The change from paper- to computer-based testing requires careful consideration, as students taking the assessment are faced with different types of response modalities (e.g., a keyboard and mouse or a touchpad or touchscreen, compared to a pencil and a paper sheet to record the answers). This section describes methods for linking the paper-based and the computer-based assessment data, utilizing appropriate extensions of IRT models to establish this link. Chapter 13 of this volume presents country-by-country data based on comparisons of the computer-based eTIMSS 2019 assessments and the paperbased bridge assessments. These comparisons focus on observed item statistics as well as estimates of expected proficiency scores.

Despite the advantages of computer-based assessments, the move from a paper- to a computerbased assessment mode poses challenges for the measurement of trend over time because the results of an assessment administered in different modes may not be directly comparable. One concern is that some assessment items may not function the same across modes and may differ in their difficulty, discrimination, or with respect to the composition of skills they tap into. Mode effects may manifest as differential item functioning (DIF) by (at least) some of the items when comparing equivalent groups across different assessment modes. This, in turn, can affect measurement invariance and may cause undesirable changes in comparability of proficiency scores.

The following section provides an overview of the types of violations of measurement invariance and presents extensions of the IRT models described above that can be used to examine mode effects. The approach presented here was used to select an appropriate adjustment for linking the proficiency scales across modes in TIMSS 2019.

## Comparability and Measurement Invariance

There are different levels of measurement invariance (Meredith, 2003; Millsap, 2010) that have to be considered before comparing achievement from different groups or assessments across modes or over time. For valid comparisons, the assessments ideally should exhibit scalar or strong invariance for all items. This means that the same statistical quantities (IRT item parameters in this context) can be used to fit the items independent of the mode of administration. Weaker forms of invariance are metric invariance, where slope parameters are invariant across modes while intercepts are allowed to vary across modes or groups, and finally configural invariance, where the same loading pattern can be maintained.

When accounting for mode effects, scalar invariance is the gold standard, while metric invariance is a somewhat less desirable but still a manageable level of invariance as long as proper linking designs can be used to adjust for mode differences (von Davier, Khorramdel, He, Shin, \& Chen, 2019). In international assessment, any two cycles are different due to item release and new item development. Therefore, as long as a large proportion of the items reach scalar or metric invariance across modes, it is quite appropriate to have a subset of items with weaker forms of invariance, while most items show strong invariance over time and across modes. Trends measured across modalities are expected to be comparable in order to assess change, and trend measures should provide consistent statistical associations across modes, particularly with external variables central to establishing validity. Ensuring that a large proportion of items show strong invariance properties is crucial for these comparisons. It should be noted that mode effects are just one possible source of violations of measurement invariance. Other sources such as translation errors, technical issues, and language differences are routinely examined and treated as well (e.g. Oliveri \& von Davier, 2011; von Davier et al. 2006; von Davier \& Sinharay, 2013) in fully paper-based as well as in computer-based assessment.

## Assessment Design Requirements for Studying Mode Effects

To deal effectively with mode effects, the assessment design needs to involve items that are by design comparable. If only student groups are comparable and take completely different items in paper and computer-based assessments, little can be said about mode differences as items are not comparable. Paper-based assessment items converted for computer delivery so that they can be considered equivalent in terms of content, presentation, and response requirements are referred to here as by design comparable items, or comparable items for short. About 80 percent of the TIMSS 2019 trend items are in this category and provided a strong link across assessment modes (see Chapter 12: Implementing the TIMSS 2019 Scaling Methodology).

To evaluate the extent to which measurement invariance can be assumed when moving from a paper- to computer-based assessment, an appropriate data collection design is needed where the same items are administered in both modes to either the same test takers or equivalent groups of test takers. For operational efficiency, administering the assessment to each student in one mode only is often preferred, while randomly assigning students to modes so that groups taking the assessment in one or other mode are randomly equivalent and results can be compared. In this approach, the two modes of delivery can be understood as treatment assignments in an experiment, while the two randomly assigned (and hence equivalent) groups of students can be assumed to have the same proficiency distribution.

To be able to generalize from such a bridge study, a sufficiently large and representative sample for both modes is needed at the level at which inferences are planned. For example, if the level of inference is how items function in two modes on aggregate at the international level, the two samples must cover
the range of abilities that are assessed across countries. On the other hand, if the level of inference is the detection and potential treatment of mode effects at the individual country level, the samples for each country would have to be sufficiently large to enable stable estimates of item parameters at that level.

In TIMSS, this would at least require two large samples of at least the size of the TIMSS national sample ( 150 schools or more, and 1-2 classrooms of approximately 30 students), one for eTIMSS and the other for paperTIMSS. Because this was not possible due to limited resources being available at the national level, TIMSS 2019 opted for a bridge design to link modes at the international level, with eTIMSS countries selecting a full student sample for eTIMSS together with a smaller, randomly equivalent bridge sample for paperTIMSS. The bridge sample of 1,500 students provided about 375 responses per item per country and was sufficient to evaluate items for mode effects at the international level (i.e., aggregated across all samples). However, these sample sizes are not large enough to provide stable item parameter estimates for individual countries, and hence country-level studies in international contexts require a careful consideration of the limitations of the sample. An example of feasible analyses at the country level is given in Chapter 13 of this volume.

Once the data is collected in both modes, a bridge data set that provides comparable data on the previous mode of assessment, and a new mode data set, statistical analysis and psychometric modeling can commence.

## Analysis of Mode Effects Using Graphical Model Checks

As an initial comparison prior to any psychometric modeling approaches or IRT-based analysis, graphical model checks (e.g. Khorramdel \& von Davier, 2016; Rasch, 1960) can provide important insights. These checks reveal whether the rank order of item parameters and the relations between item parameters agree strongly (as they should) in the eTIMSS and paperTIMSS samples, ensuring that invariance assumptions implemented in subsequent statistical and psychometric modeling are tenable. For this analysis, item parameters for comparable items were estimated separately for the eTIMSS and paperTIMSS samples but pooled across countries to focus on mode comparisons only and to ensure sufficient sample sizes for accurate calibrations.

Exhibits 11.3 through 11.6 show examples of location parameter comparisons between modes using the eTIMSS and paperTIMSS data (including bridge) for each grade and subject assessed by TIMSS. It should be noted that eTIMSS bridge samples responded to trend items only, so comparisons for "new" items are less informative for mode comparisons due to different countries taking the new items in different modes.

Exhibit 11.3: Location Parameter Comparison between eTIMSS and paperTIMSS 2019Grade 4 Mathematics

Exhibit 11.4: Location Parameter Comparison between eTIMSS and paperTIMSS 2019Grade 4 Science

Exhibit 11.5: Location Parameter Comparison between eTIMSS and paperTIMSS 2019Grade 8 Mathematics

Exhibit 11.6: Location Parameter Comparison between eTIMSS and paperTIMSS 2019— Grade 8 Science

Exhibits 11.3 through 11.6 show that item location parameters (item difficulties) are highly correlated across the eTIMSS and paperTIMSS modes. A similar level of agreement was found for other parameter types. These results suggest there is excellent agreement between paper- and computer-based items for items that were deemed comparable based on design and response similarity across modes. The presence of some outliers, however, suggests that some items differ between modes and may require separate parameter estimates. Note that there is always estimation error in item parameter estimates and, therefore, parameter estimates from two finite samples are never perfectly correlated, even for two independent samples taking the same assessment in the same mode. However, the cross-mode correlations between item parameters of paper- and computer-based items for TIMSS 2019 are very high, suggesting that a strong link can be established so that computer- and paper-based results across countries can be reported on the same scale.

Before such a link can be established, the extent to which some items may exhibit mode effects, and may require separate estimates, has to be carefully examined during IRT scaling. The next section provides an overview of IRT model extensions that facilitate the examination of mode effects and for linking across assessment modes by testing for, and if present, utilizing the invariance of item parameters across modes.

## Mode Effect Models

While graphical model checks provide a useful starting point for examining overall agreement between item parameters from different samples and for exploring potential drivers of these differences, they do not provide the most rigorous way to account for mode effects in proficiency estimation (e.g. von Davier \& von Davier, 2007). Extensions of IRT models such as the ones described subsequently can be used to analyze mode differences with a high level of statistical rigor in order to obtain unbiased proficiency estimates by utilizing the equivalency of the bridge and eTIMSS samples in the analysis.

IRT models have been extended to include various types of mode effect parameters in order to provide information about whether the mode effect is best described by an overall difference between assessment modes (i.e., the difference between modes is changing the difficulty of all comparable assessment items by a constant), whether it is a person- or group-specific effect that may have an impact differentially on different groups (i.e., some test takers are more affected by mode differences than others), or whether it is an item-specific effect that is only impacting a subset of tasks.

These different hypotheses about mode differences can be checked by formalizing these within a general latent variable model (von Davier, 2008; von Davier, Xu, \& Carstensen, 2011) and applying these models to the eTIMSS and bridge data. Taking the two-parameter logistic model (Birnbaum, 1968) as the base model, von Davier et al. (2019) introduced additional model parameters to formalize various assumptions of how mode effects may impact item functioning. Let

$$
\begin{equation*}
P\left(x=1 \mid \theta, \alpha_{i}, \beta_{i}\right)=\frac{\exp \left(\alpha_{i} \theta+\beta_{i}\right)}{1+\exp \left(\alpha_{i} \theta+\beta_{i}\right)} \tag{11.8}
\end{equation*}
$$

denote the probability of a correct response by a respondent with proficiency $\theta$ for an item $i$ with parameters $\alpha_{i}, \beta_{i}$. The notation used in (11.2) can be transformed to the customary notation by letting $a=\alpha / 1.7$ and $b=-\beta / \alpha$.

## Mode Effects on the Item Level

The most parsimonious mode effect assumption is that all items show strong invariance and need to be "shifted" by a certain amount with respect to their difficulty when comparing groups taking the assessment in one mode of administration with another. This could be because, for example, reading any item stem or stimulus is generally harder or easier (by the same amount for all items) on the computer, or responding using the keyboard or a mouse is more tedious or simpler than bubbling in a response on an answer sheet. Here, the mode is a "treatment" that changes the apparent average proficiency between groups, which needs to be corrected for using the equivalency of randomly assigned groups taking the bridge and the eTIMSS assessment, respectively. A mode treatment effect of this type that applies homogeneously to all comparable items can be controlled for by adding the same constant to each of the item difficulty parameters. This general mode effect parameter $\delta_{m}$ quantifies how much more difficult (or easy) all the comparable items appear when presented in a mode other than the reference mode (11.9). In terms of standard IRT linking designs, this general mode effect shift is similar to a non-equivalent groups design with anchor test (NEAT). However, the groups were randomly assigned, so the non-equivalence is really caused by the treatment (mode) that has an overall effect, which can be controlled for through the $\delta_{m}$ that reflects treatment differences.

Formally, for items presented in the "new" mode, we assume that

$$
\begin{equation*}
P\left(X=1 \mid \theta, \alpha_{i}, \beta_{i}, \delta_{m}\right)=\frac{\exp \left(\alpha_{i} \theta+\beta_{i}-1_{\{I+1, \ldots, 2 l\}}(i) \delta_{m}\right)}{1+\exp \left(\alpha_{i} \theta+\beta_{i}-1_{\{I+1, \ldots, 2 l\}}(i) \delta_{m}\right)} . \tag{11.9}
\end{equation*}
$$

This can be thought of as a model for twice the number of items. The indicator function $1_{\{I+1, \ldots, 2 I\}}(i)$ equals 1 if the item index is in the second half, that is, the range $I+1, \ldots, 2 I$. The first $1, \ldots, I$ items are the paper-based items without mode effect, and the items in the new mode are indexed by $I+1, \ldots, 2 I$. In this notation it is assumed that item $i$ and item $i+I$ are the same but administered in different modes. This leads to a model with $2 I$ items (instead of $I$ items for each delivery mode) in which the difficulty parameters for items presented in one mode (say, paper) are assumed to be $\beta_{i}$ for $i=1, \ldots, I$ and the item parameters for the other mode (say, computer) are appended as parameters $\beta_{j}$ for $j=I+1, \ldots, 2 I$ and arranged in the same order and constrained to follow $\beta_{j}=\beta_{i}-\delta_{m}$.

In the bridge design, each test taker receives a subset of items from either the paper-based items, indexed by $i=1, \ldots, I$, or the computer-based items indexed by $i=I+1, \ldots, 2 I$. The two assignments are based on randomly equivalent respondents that only differ in the treatment they received, the mode of assessment. Note that this form of adjustment is equivalent to assuming the item parameters for comparable items to be strongly invariant and adjusting only for the overall mean differences, between bridge and eTIMSS sample. This model can be estimated by assuming one ability distribution across groups assessed in different modes and adding the mode parameter $\delta_{m}$ as an explanatory effect to the items administered in the new mode.

In contrast to the assumptions of a general mode effect parameter, $\delta_{m}$, one could argue that not all items are affected when moving from paper to computer: Some could be more difficult, some could be at the same difficulty level, and some could even get easier. This leads to a model with weaker invariance that adds an item-specific effect $\delta_{m i}$ to the difficulty parameter. This can be written as a DIF parameter, quantifying item-specific changes from paper presentation, namely

$$
\begin{equation*}
P\left(X=1 \mid \theta, \alpha_{i}, \beta_{i}, \delta_{m}\right)=\frac{\exp \left(\alpha_{i} \theta+\beta_{i}-1_{\{I+1, \ldots, 2 l\}}(i) \delta_{m i}\right)}{1+\exp \left(\alpha_{i} \theta+\beta_{i}-1_{\{I+1, \ldots, 2 l\}}(i) \delta_{m i}\right)} . \tag{11.10}
\end{equation*}
$$

The difference in comparison to the model of metric (or "weak") factorial invariance (Meredith, 1993) is that the computer-based item difficulties relative to the paper-based difficulties are decomposed into two components, that is $\beta_{i+I}=\beta_{i}-\delta_{m i}$, while continuing to assume that $\alpha_{i+I}=\alpha_{i}$ for the slope parameters. This decomposition indicates that the difficulties are shifted by some (item or item feature)dependent amount, the shift being applied to one mode on an item-by-item basis-one that is being considered the reference mode with no shift. Assuming ability equivalence, the average treatment (mode) effect can be assessed by calculating $\frac{1}{I} \sum_{i} \delta_{m i}=\bar{\delta}_{m}$. This average effect can be compared against the estimated average effect from model (11.9).

The model in equation (11.10) with constraints across both modes on slope parameters, as well as potential constraints on the DIF parameters, establishes weak (also sometimes called metric) invariance (e.g., Meredith, 1993) IRT model, whereas model (11.9), which TIMSS 2019 was able to use, establishes strong invariance. The average mode effect is equivalent to a shift in group means when the item parameters are invariant in model (11.9), whereas model (11.10) allows individual items to deviate from this average mode shift. The larger the number of constraints of the type $\delta_{m i}=c$ for some constant adjustment can be assumed, the more we approach a model with strong factorial invariance, that adjusts only for overall mode treatment differences. Note that an overall adjustment as used in TIMSS 2019 retains the equality of means and variances of the latent variable in both modes as both groups were randomly assigned to modes but selected from a single population.

## Mode Effects on the Respondent or Proficiency Level

For completeness of discourse, if it cannot be assumed that the mode effect is a constant (even if item dependent) shift for all respondents, then an additional proficiency may be required to accurately model response probabilities for the new mode. This leads to a multidimensional model with a second latent variable that is added to the item function for items administered in the new mode. The expression $\alpha_{m i} \vartheta$ in the model (11.11) below indicates that there is a second slope parameter $\alpha_{m i}$ for items $(i=I+1, \ldots, 2 I)$ administered in computer mode and that the effect of the mode is person dependent and quantified through a second latent variable $\vartheta$. We obtain

$$
\begin{equation*}
P\left(X=1 \mid \theta, \alpha_{i}, \alpha_{m i}, \beta_{i}, \vartheta\right)=\frac{\exp \left(\alpha_{i} \theta+\beta_{i}-\alpha_{m i} \vartheta\right)}{1+\exp \left(\alpha_{i} \theta+\beta_{i}-\alpha_{m i} \vartheta\right)} \tag{11.11}
\end{equation*}
$$

Note that the common slope parameters, $\alpha_{i}$, and item difficulties, $\beta_{i}$, are, as before in models (11.9) and (11.10), equal across modes. However, an additional "mode-slope" parameter $\alpha_{m i}$, for $i=I+1, \ldots, 2 I$, is estimated, with constant $\alpha_{m i}=0$ for $i \leq I$ for the reference items that are not affected by mode changes. For the joint distribution $f(\theta, \vartheta)$ one assumes uncorrelated latent variables, $\operatorname{cov}(\theta, \vartheta)=0$, to ensure identifiability in the bridge design.

In equation (11.11) it is assumed that the effect of the person "mode" variable varies across items, which may be the more plausible variant, but a model with item-invariant effects $\alpha_{m} 9$ (a Rasch variant of a random mode effect) also is feasible. However, an item-specific model is more likely to provide better model data fit. As in model (11.10), the link between modes can be viewed as increasingly more invariant as more slope parameters can be assumed to be $\alpha_{m i}=0$ for items in the new mode. Each constraint $\alpha_{m i}=0$ makes the respective item response functions for items $i$ and $i+I$ identical across modes.

## Application of Mode Effect Models to TIMSS 2019

The models presented above were available to accommodate a range of mode effects and item invariances across the two TIMSS assessment modes. However, based on the very good agreement between bridge and eTIMSS sample estimates (see Exhibits 11.3-11.6) of item parameters for the TIMSS 2019 comparable items, it was concluded that only a small overall mode adjustment constant was necessary (see Chapter 12). This adjustment was estimated separately for mathematics and science at the fourth and eighth grades. Additional analyses with standard IRT linking methods (Haebera, 1980; Marco, 1977; von Davier \& von Davier 2007; Xu \& von Davier, 2008b) were in agreement with the results obtained from model (11.9) as well as with the graphical model checks, so that this convergence of results supported the use of an overall mode adjustment.

Using a single adjustment of parameter for each subject/grade combination based on the randomly equivalent samples from the bridge and eTIMSS samples keeps the scaling methods in line with prior

TIMSS trend scaling methods, and enables country-level mode effect analyses as presented in Chapter 13. The eTIMSS sample and bridge sample were of central importance for linking through model (11.9) because, as randomly equivalent groups with a large set of comparable items as anchors, they form the basis for estimating the adjustment using the proficiency distribution estimates in the two modes.

After establishing the size of the item parameter adjustment required by model (11.9), this adjustment was applied to each of the comparable items in scaling the eTIMSS data, resulting in eTIMSS data on the same scale as the bridge data. The effect of the adjustment was verified in terms of item fit and scaling outcomes using country adjustment compared to the separate scaling of items in equivalent groups designs (see Chapter 12).

The major outcome of the foregoing procedure was that the eTIMSS 2019 proficiency data were successfully linked to the existing TIMSS proficiency scales so that results from the paper- and the computer-based assessments can be directly compared without any further adjustment. Very high levels of comparability of item parameters across the two administration modes were established, so that the mode-adjusted item parameters can be used in the population model described in the following section. This population model is used to generate plausible values for estimation of group level results and to examine the relation between student proficiency and other contextual variables. The strong link of paperTIMSS and eTIMSS across modes based on comparable items and equivalent groups design enabled reporting TIMSS 2019 on the same scale for all participating countries. It also formed the basis of an important and final step that provides the proficiency database by means of a country specific population modeling approach as described in the next section.

## Population Models Integrating Achievement Data and Context Information

TIMSS uses a latent regression (or population) model to estimate distributions of proficiencies based on the likelihood function of an IRT model, as introduced in the first section of this chapter, and a latent regression of the proficiency on contextual data (von Davier, Gonzalez, \& Mislevy, 2009; von Davier et al., 2006). This approach can be viewed as an imputation model for the unobserved proficiency distribution that aims at obtaining unbiased group-level proficiency distributions. The approach requires the estimation of an IRT measurement model, which provides information about how responses to the assessment items depend on the latent proficiency variable. In addition, the latent regression, which provides information about the extent to which background information is related to achievement, is used to improve estimates by borrowing information through similarities of test takers with respect to context variables and the way these relate to achievement. The population model is estimated separately for each country and in TIMSS 2019 five plausible values (PVs) representing the proficiency variable are drawn
from the resulting posterior distribution for each respondent in each cognitive domain. It is important to note that PVs are not individual test scores and should only be used for analyses at the group-level using the procedures described in this report and available, for example, through the IDB analyzer.

Population models are examples of high dimensional imputation models, and utilize a large number of context variables in the latent regression to avoid omission of any useful information collected in the questionnaires (von Davier et al., 2006; von Davier et al., 2009; von Davier \& Sinharay, 2013). Prior to estimating the latent regression model, a principal component analysis (PCA) of the student context variables is used to eliminate collinearity by identifying a smaller number of orthogonal predictors that account for most of the variation in the background variables ( $90 \%$ in the case of TIMSS 2019).

In order to fully describe the proficiency estimation procedure, the data from the context questionnaires are combined with the responses obtained from the achievement items. The complete observed data for a person $n$ can be expressed as $d_{n}=\left(x_{n 1}, \ldots, x_{n 1}, g_{n}, z_{n 1}, \ldots, z_{n B}\right)$, where $z_{n 1}, \ldots, z_{n B}$ represent the context information; $x_{n 1}, \ldots, x_{n I}$ represent the answers to the achievement items, and $g_{n}$ represents the country or population the respondent was sampled from.

The estimation of student proficiency with IRT models can utilize distributions of proficiency in the population of interest. A population model that incorporates contextual data utilizes this information by specifying a second level model that predicts the distribution of proficiency as a function of contextual variables. The conditional expectation in this model is given by

$$
\begin{equation*}
\mu_{n}=\sum_{b=1}^{B} \beta_{g(n) b} z_{n b}+\beta_{g(n) 0} . \tag{11.12}
\end{equation*}
$$

This expectation utilizes the available information on how context variables relate to the proficiency. The distribution of proficiency is assumed to be normally distributed around this conditional expectation, namely $\theta_{n} \sim N\left(\mu_{n}, \sigma\right)$.

Together with the likelihood of the responses expressed by the IRT model, this provides a model for the expected distribution of proficiency given the context data $z_{n 1}, \ldots, z_{n B}$ and the responses to the TIMSS items. In other words, the model implements the assumption that the posterior distribution of proficiency depends on the context data as well as on the observed achievement. Given the amount of contextual data is much larger than the number of countries typically participating in an assessment, the added value of using a model that includes contextual information for every test taker is considerable. Therefore, if background variables are selected so that correlations with proficiency are likely, one obtains a distribution around the expected value given in (11.12) that is noticeably more accurate than a countrylevel distribution of proficiency.

Formally, this approach can be described as a multiple (latent) regression model that regresses the latent proficiency variable on background data collected in context questionnaires. The estimation of the regression is addressed separately within countries. The regression is country specific since it cannot be assumed that context information has the same regression effects across different participating countries. Mothers' highest level of education, for example, is well known as a strong predictor of student performance, but this association can be moderated by other factors at the level of educational systems, so that in some countries it may be stronger than in others.

There are several ways to address the estimation of the latent regression parameters. In TIMSS and other large-scale assessments, the latent trait (proficiency) is determined by the IRT model estimated across countries in a previous step. Then the (latent) regression model is estimated treating the item parameters from the previous IRT estimation as fixed quantities. This ensures that the invariance properties that were determined through IRT estimation and potential mode effect adjustments across countries are applied equally to each national dataset (see for example, Mislevy \& Sheehan, 1992; Thomas, 1993; von Davier et al., 2006; von Davier \& Sinharay, 2013).

## Group-Level Proficiency Distributions and Plausible Values

The goal of the psychometric methods described above is to produce a useful database that contains comparable, valid, and reliable information for reporting student proficiency and for secondary users of the TIMSS assessment data. This information comes in the form of likely proficiency estimates for all respondents given their responses to the assessment items and their answers to the context questionnaires. Integrating the IRT model described in the first part of this chapter with the regression model introduced in the previous section, we can estimate the probability of the responses, conditional on context information, as

$$
\begin{equation*}
P_{g}\left(\mathbf{x}_{n} \mid \mathbf{z}_{n}\right)=\int_{\theta} \prod_{i=1}^{I} P_{i g}\left(x_{n i} \mid \theta\right) \phi\left(\theta ; \sum_{b=1}^{B} \beta_{g b} z_{n b}+\beta_{g 0}, \sigma\right) d \theta . \tag{11.13}
\end{equation*}
$$

This equation provides the basis for the imputation of proficiency estimates that are commonly known as plausible values (Mislevy, 1991). To allow a more compact notation, we use

$$
P_{i g}\left(x_{n i} \mid \theta\right)=P_{i g}(X=1 \mid \theta)^{x_{n i}}\left[1-P_{i g}(X=1 \mid \theta)\right]^{1-x_{n i}}
$$

This model enables inferences about the posterior distribution of the proficiency $\theta$, given both the TIMSS assessment items $x_{1}, \ldots, x_{I}$ and the context information $z_{1}, \ldots, z_{B}$. The posterior distribution of the proficiency given the observed data can be written as

$$
\begin{equation*}
P_{g}\left(\theta \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right)=\frac{\prod_{i=1}^{I} P_{i g}\left(x_{n i} \mid \theta\right) \phi\left(\theta ; \sum_{b=1}^{B} \beta_{g b} z_{n b}+\beta_{g 0}, \sigma\right)}{\int_{\theta} \prod_{i=1}^{I} P_{i g}\left(x_{n i} \mid \theta\right) \phi\left(\theta ; \sum_{b=1}^{B} \beta_{g b} z_{n b}+\beta_{g 0}, \sigma\right) d \theta} . \tag{11.14}
\end{equation*}
$$

An estimate of where a respondent $n$ is most likely located on the proficiency dimension can be obtained by

$$
\begin{equation*}
E_{g}\left(\theta \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right)=\int_{\theta} \theta P_{g}\left(\theta \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right) d \theta \tag{11.15}
\end{equation*}
$$

The posterior variance, which provides a measure of uncertainty around this expectation, is calculated as follows:

$$
\begin{equation*}
V_{g}\left(\theta \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right)=E_{g}\left(\theta^{2} \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right)-\left[E_{g}\left(\theta \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right)\right]^{2} \tag{11.16}
\end{equation*}
$$

Using these two estimates (the mean and variance) to define the posterior proficiency distribution, it is possible to draw a set of plausible values (Mislevy, 1991) from this distribution for each student. Plausible values are the basis for all reporting of proficiency data in TIMSS, allowing reliable group level comparisons because they are based not only on students' answers to the TIMSS items but also reflect how contextual information is related to achievement.

Note that the correlations between context and proficiency are estimated separately in each country, so that there is no bias or inaccurate attribution that could affect the results. Although the expected value of the country level proficiency is unchanged whether context information is used or not, the advantage of including context information plays out when making group-level comparisons. It can be shown analytically and by simulation (von Davier et al., 2009) that including context information in a population model eliminates bias in group level comparisons using this information, and using country specific population models with context variables ensures there is no bias in country level average proficiency data.

In summary, the plausible values used in TIMSS and other large-scale assessments are random draws from a conditional normal distribution

$$
\begin{equation*}
\widetilde{\theta}_{n g} \sim N\left(E_{g}\left(\theta \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right), \sqrt{V_{g}\left(\theta \mid \mathbf{x}_{n}, \mathbf{z}_{n}\right)}\right) \tag{11.17}
\end{equation*}
$$

that depend on response data $x_{n}$ as well as context information $z_{n}$ estimated using a group-specific model for each country $g$. That means two respondents with the same item responses, but different context information will receive a different predicted distribution of their corresponding latent trait. Although this may seem incoherent—and would not be adequate to assign test scores to individual students-it is important to remember that TIMSS and similar assessments are population surveys, not individual assessments, and that it is necessary to include context information in order to achieve unbiased comparisons of population distributions (e.g. Little \& Rubin, 1987; Mislevy, 1991; Mislevy \& Sheehan, 1992; von Davier et al., 2009). Consequently, plausible values are not and should never be used or treated as individual test scores.

In order to provide a more detailed picture of the analytic methods, this chapter focused on the rationale behind the methodologies used in TIMSS 2019, ranging from IRT, to mode effects, to population modeling for unbiased reporting of group level proficiency distributions. Additional information is available in the chapter on scaling outcomes (Foy, Fishbein, von Davier, \& Yin, 2020) and the chapter on examining country-level mode related quantities (von Davier, Foy, Martin, \& Mullis, 2020).

## CHAPTER 12

## Implementing the TIMSS 2019 Scaling Methodology

Pierre Foy<br>Bethany Fishbein Matthias von Davier<br>Liqun Yin

## Introduction

The TIMSS assessments cover a wide range of topics in mathematics and science at two grade levels. Given this broad coverage, a matrix-sampling booklet design was used such that each student was administered only a subset of the entire TIMSS mathematics and science item pools. Given the complexities of the data collection and the need to describe student achievement on a scale that represents the entirety of the assessment framework, TIMSS relied on Item Response Theory (IRT) scaling to provide accurate measures of student proficiency distributions and trends. In order to provide unbiased estimates of student achievement and its relationship to contextual variables, the TIMSS scaling approach used a latent regression population model (also called a conditioning model) with subsequent multiple imputation to obtain plausible values representing proficiency in mathematics and science for all students. To enhance the reliability of the imputed student scores, the TIMSS latent regression scaling approach used the available student context data in the process. A detailed description of the TIMSS scaling methodology can be found in Chapter 11.

The TIMSS \& PIRLS International Study Center, responsible for the development and management of the TIMSS assessments, undertook the psychometric scaling and population modeling of the TIMSS achievement data. The scaling was based largely on a concurrent calibration of the TIMSS 2019 data together with data from the previous TIMSS 2015 cycle for measuring trends from cycle to cycle, which has been implemented successfully in the past. However, with the dual administration modepaperTIMSS and eTIMSS, the TIMSS scaling approach for 2019 involved additional psychometric analyses so that the 2019 computer-based data were linked to be reported on the same scales as the 2019 paper-based results and trend measurements were maintained from past assessments.

In 2019, TIMSS began the transition to computer-based assessment by introducing a computerized version known as eTIMSS. Half the participating countries in 2019 chose to administer the eTIMSS version, with the other half retaining the traditional paper-based administration-referred to as paperTIMSS. The major challenge in scaling the 2019 data was linking both the eTIMSS and paperTIMSS data on the same scale while maintaining comparability to the previously established TIMSS achievement trend scales.

In 2017, the TIMSS \& PIRLS International Study Center conducted an item equivalence study, using a counterbalanced experimental design, to examine whether switching from paper and pencil to computer based administration would likely affect the psychometric properties of the TIMSS mathematics and science achievement items at the fourth and eighth grades (Fishbein, Martin, Mullis, \& Foy, 2018). The study showed that, on average, performance was higher on paperTIMSS than on eTIMSS items at both grades, especially for mathematics. Consequently, in expectation of this mode of administration effect in the 2019 main data collection, it was considered prudent to include a bridge component in the data collection plan. This involved eTIMSS countries administering a version of the paperTIMSS assessment (a subset of the achievement items-the "trend" items previously administered in 2015) in addition to the main eTIMSS assessment to randomly selected, equivalent groups of students. This bridge allowed to directly compare and link the psychometric properties of items available in both modes on the basis of equivalent student samples in countries that chose eTIMSS.

Altogether, 64 countries and 8 benchmarking entities participated in TIMSS 2019. Countries participating in either paperTIMSS or eTIMSS had national samples of approximately 150 schools and 4,000 students per grade. To provide bridging data between the paperTIMSS and eTIMSS assessments, eTIMSS trend countries-eTIMSS 2019 countries that also participated in 2015-administered paperTIMSS booklets consisting of trend items to an additional sample of 1,500 students, sampling from the same schools as the full eTIMSS samples to the extent possible. Selected results on country level comparisons of the bridge and the eTIMSS samples are provided in Chapter 13 of this volume.

As an additional option, countries participating at the fourth grade in paperTIMSS that were concerned the regular TIMSS mathematics assessment would be too difficult for their students could choose to administer a "less difficult" mathematics assessment.

## Developing eTIMSS and paperTIMSS

As described in the TIMSS 2019 assessment design (Martin, Mullis, \& Foy, 2017), each of the four TIMSS 2019 assessments (mathematics and science at fourth and eighth grades) consisted of 14 blocks of achievement items, six of which were developed for first time use in 2019 and eight of which were administered previously in 2015 and re-administered in 2019 (the trend items). Of the eight trend blocks administered in 2015, three also were administered as part of the 2011 assessment.

The development of the six blocks of new items for each TIMSS 2019 assessment followed the content and cognitive domain specifications described in the TIMSS 2019 Assessment Frameworks (Mullis \& Martin, 2017). While adhering to the framework specifications, the approach was first to develop an eTIMSS version of the items, capitalizing as much as possible on the eTIMSS computer-based environment by including new item types such as drag-and-drop and drop-down menus, and automated scoring through number pad entry. The eTIMSS version of an item was then adapted to the paper-andpencil environment for its paperTIMSS version, making the paperTIMSS version as similar as possible to the eTIMSS version. The goal was to maximize the comparability of eTIMSS and paperTIMSS by having the two versions of the assessment measure the same mathematics and science constructs using the same items as much as possible, while also capitalizing on the benefits of the computer based environment for eTIMSS.

The eight blocks of trend items for each assessment were developed at a time when paper and pencil was the only mode of administration, and so these existed only in paper format. An eTIMSS version was developed for each of these items, retaining the look and feel of the paper versions as much as possible. This work was conducted as part of the item equivalence study, where it was estimated that about 87 percent of the items appeared fairly equivalent in both versions (Fishbein et al., 2018).

The less difficult mathematics assessment at the fourth grade also consisted of 14 item blocks, eight of which were trend blocks from 2015 and six newly developed. All the less difficult item blocks existed only in paper format. Four of the regular fourth grade mathematics item blocks were shared with the less difficult mathematics assessment, the basis for linking the two assessments. As there was not a less difficult science assessment, countries administering the less difficult mathematics assessment also administered the regular fourth grade science assessment.

Exhibit 12.1 reports the numbers of items from the TIMSS 2019 assessments included for achievement scaling. In addition to newly developed eTIMSS items, the eTIMSS 2019 assessment also included extended mathematics and science assessment tasks called Problem Solving and Inquiry Tasks, or "PSIs," as in Exhibit 12.1. These items were not part of the IRT-based scaling reported here, but will be added to the TIMSS 2019 International Database at a later date. Countries' achievement on the PSIs will be described in a special analysis report to be released in 2021.

Exhibit 12.1: Number of Items in the TIMSS 2019 Assessments

| Assessments | Grade 4 |  | Grade 8 |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Mathematics | Science | Mathematics | Science |
| paperTIMSS | 169 | 168 | 206 | 211 |
| Less Difficult TIMSS Mathematics |  |  | - | - |
| Bridge | 177 | 168 | - | 118 |
| eTIMSS | Regular Items | 92 | 95 | 114 |
|  | PSI Items | 171 | 169 | 206 |

* The less difficult TIMSS mathematics assessment shared 46 mathematics items and all 168 science items with paperTIMSS.

Exhibit 12.2 shows the number of participating countries and benchmarking participants in TIMSS 2019, across the various assessments offered. It also indicates the number of trend countries (countries that also participated in 2015) for the concurrent calibration models.

Exhibit 12.2: Number of Countries Participating in TIMSS 2019

|  |  | All Countries | Trend Countries | Benchmarking Participants |
| :---: | :---: | :---: | :---: | :---: |
| Grade 4 |  |  |  |  |
| paperTIMSS |  | 17 | 14 | 0 |
| Less Difficult TIMSS Mathematics |  | 11 | 3 | 0 |
| eTIMSS | with Bridge* | 28 | 27 | 0 |
|  | without Bridge | 2 | 0 | 6 |
| Total |  | 58 | 44 | 6 |
| Grade 8 |  |  |  |  |
| paperTIMSS |  | 17 | 14 | 2 |
| eTIMSS | with Bridge | 19 | 19 | 0 |
|  | without Bridge | 3 | 0 | 5 |
| Total |  | 39 | 33 | 7 |

* Austria, although not a trend country, opted to administer the Bridge booklets.

## The paperTIMSS Assessment

At the eighth grade and for most countries at the fourth grade, the paperTIMSS assessment design replicated the assessment design from the more recent previous TIMSS assessment cycles. The 14 mathematics and 14 science item blocks at each grade were assembled into 14 assessment booklets, with each booklet having two mathematics and two science item blocks and each item block appearing in two booklets.

Countries participating at the fourth grade had the option of administering the less difficult mathematics assessment instead of the regular fourth grade mathematics assessment. The less difficult assessment consisted of four mathematics item blocks shared with regular TIMSS and 10 mathematics item blocks that were developed to be less difficult than the regular TIMSS fourth grade mathematics assessment. These were combined with the regular fourth grade science item blocks, with booklets mimicking the regular paperTIMSS booklets, having two blocks of mathematics items (either less difficult or regular) and two blocks of science items.

At the fourth grade, 17 countries participated in paperTIMSS, with 14 of them having participated in the TIMSS 2015 assessment and considered as trend countries for the concurrent calibration. Additionally, 11 countries participated in the less difficult mathematics assessment, three of which were trend countries. At the eighth grade, 17 countries and two benchmarking participants participated in paperTIMSS, with 14 countries being trend.

## The eTIMSS Assessment

The eTIMSS assessment design emulated the paperTIMSS design in the way the item blocks were assembled into student booklets ("block combinations" in eTIMSS parlance) and spiraled across computer-based assessment sessions. There was, however, no less difficult fourth grade mathematics option in eTIMSS. A further difference was that eTIMSS included two blocks of Problem Solving and Inquiry (PSI) tasks and items in both mathematics and science at each grade, with one or two tasks in each block. The PSIs were a new initiative, introduced for the first time in 2019. For data collection, the PSI blocks were assembled in two extra block combinations for each assessment, with two mathematics and two science PSI blocks in each block combination. The two PSI block combinations were included in the normal rotation of eTIMSS block combinations and, while there was no overlap between regular eTIMSS and PSI items (i.e., no student got both eTIMSS and PSI items), the PSI blocks were administered to a randomly equivalent sub-sample of students within selected classes and schools.

Although the newly developed PSI tasks were designed to form an integral part of the mathematics and science assessments, they had no counterpart in paperTIMSS and were not included in the main reporting scales for 2019. Rather, they were included with the eTIMSS 2019 items in a second, separate scaling model and the results reported separately. This allowed for examining how the PSI items fit in
with the regular items in psychometric terms and prepared for their full inclusion in TIMSS in the 2023 assessment cycle.

Thirty countries and six benchmarking participants participated in eTIMSS at the fourth grade, and 22 countries and five benchmarking participants at the eighth grade.

## The eTIMSS Bridge Booklets

Trend countries participating in eTIMSS 2019—countries that also participated in TIMSS 2015-were required to administer a set of eight assessment booklets consisting entirely of the eight mathematics and eight science paperTIMSS trend blocks at each grade. Six of these booklets were exactly the same as those administered in 2015 and two contained blocks also administered in 2015 but in a different combination. The data from these paper bridge booklets were used to link the eTIMSS assessment to the paperTIMSS assessment and the TIMSS trend scales, relying on equivalent populations between the eTIMSS and bridge samples. They also served to provide countries with valuable data on the behavior of mode effects in their countries (see Chapter 13).

The paper bridge booklets were administered to national samples of 1,500 students drawn to be randomly equivalent to the national eTIMSS samples. Of the 30 eTIMSS countries participating at the fourth grade, 27 trend countries administered the paper bridge booklets. In addition, one non-trend country (Austria) administered bridge booklets to fourth grade students for their own research purposes. At the eighth grade, 19 of the 22 eTIMSS countries administered the paper bridge booklets.

## Overview of Scaling the TIMSS 2019 Achievement Data

Scaling and linking the TIMSS 2019 data needed to address two major objectives. First, 2019 results from either paperTIMSS or eTIMSS should measure the same mathematics and science constructs and be reported on the same scales. Second, these 2019 results should maintain trends with past TIMSS assessments. With these two goals in mind, the scaling for each subject and grade was conducted in four major phases.

1. Scaling the paperTIMSS and Bridge Data: Relying on the usual TIMSS concurrent calibration approach, data from the paperTIMSS trend countries and bridge data from the eTIMSS trend countries were scaled together with their data from TIMSS 2015 to estimate item parameters for the paperTIMSS and bridge data and to establish the scale transformation required to place these results on the TIMSS trend scales.
2. Scaling the Fourth Grade Less Difficult Mathematics Data: Special scale linking approaches were implemented to scale the fourth grade mathematics and science data from the 11 countries that opted to administer this assessment. These methods relied on linkages with the TIMSS 2019 fourth grade assessment and the TIMSS Numeracy 2015 assessment to place these results on the TIMSS trend scales.
3. Scaling the eTIMSS Data: Scaling the eTIMSS data was based in large part on its linkage to the bridge data that were collected from equivalent samples. The random assignment of equivalent student groups to the bridge and the eTIMSS assessment was utilized in linking by using an anchor test design. The common set of items was based on a substantial subset of eTIMSS items found to be psychometrically equivalent to their paperTIMSS counterparts.
4. Scaling the PSI Items: Although the main reporting results were based on the paperTIMSS and eTIMSS items, it was of great interest to evaluate the introduction of items from the Problem Solving and Inquiry tasks into the TIMSS assessments. This item calibration relied on scaling the PSI items along with the eTIMSS items. This last phase of the TIMSS 2019 achievement scaling will be described in a forthcoming publication to be released in 2021, along with the results.
Each of these phases involved four major tasks: calibrating the achievement items (estimating model parameters for each item), creating principal components from the student questionnaire data for use in conditioning, generating plausible values (proficiency estimates) for mathematics and science, and placing these plausible values on the metrics used to report trend results from previous assessments. The scaling procedures produced plausible values for the mathematics and science scales at both the fourth and eighth grades. In addition, plausible values were produced for the content and cognitive domains of mathematics and science. The IRT models and population models used are described in Chapter 11 of this volume.

Before scaling the achievement data, TIMSS conducted an extensive item-by-item review of descriptive item statistics for all countries to evaluate the quality of the assessment items and to identify any unexpected or problematic item properties based on a review of classical test theory item statistics. This review included analyses of change over time with respect to percent correct and partial credit proportions, omit rates, item discrimination and other classical item statistics for trend items from the 2015 assessment, as well as differences between items common to eTIMSS and the paper bridge booklets. These item review activities are described in Chapter 10.

## Treatment of Omitted and Not-Reached Responses

Given the matrix-sampling design used by TIMSS, whereby a student is administered only a sample of the 14 assessment blocks (two mathematics and two science blocks), most item responses are missing by design for each student. However, missing data can also result from a student not answering an item, which can occur when the student does not know the answer, omits the item by mistake, or does not have sufficient time to attempt the item. An item is considered "not reached" when-within part 1 or part 2 of a booklet ${ }^{1}$-the item itself and the item immediately preceding it are not answered, and there are no other items completed in the remainder of that part of the booklet.

Not-reached items were treated differently in estimating item parameters and in generating student plausible values. In estimating the item parameters, items in the assessment booklets that were considered not to have been reached by students were treated as if they were not administered. However, not-reached items always were recoded and treated as incorrect when student plausible values were generated.

This treatment of not-reached items was applied to all scaling procedures. Omitted responses always were treated as incorrect.

## Scaling the paperTIMSS and Bridge Data

This first phase of scaling constituted a first and fundamental step in the TIMSS 2019 concurrent calibration with TIMSS 2015 trend data to estimate the item parameters for all paperTIMSS items and determined the scale transformations that placed the TIMSS 2019 paperTIMSS achievement results on the TIMSS trend scales. These same scale transformations also were used when transforming the eTIMSS data based on subsequent calibrations.

The metric of the TIMSS reporting scales for overall mathematics and science at each grade level were originally established in TIMSS 1995 by setting the mean of the national average scores for all countries that participated in TIMSS 1995 to 500 and the standard deviation to 100 . To enable measurement of trends over time, achievement data from successive TIMSS assessments were transformed to these same metrics. This was done by concurrently scaling the data from each successive assessment with the data from the previous assessment-a process known as concurrent calibration-and applying linear transformations to place the results from each successive assessment on the same scale as the results from the previous assessment. This procedure enabled TIMSS to measure trends across all seven assessment cycles: 1995, 1999, 2003, 2007, 2011, 2015, and 2019.

The first step in linking the assessments for trend scaling is to estimate (calibrate) the item parameters for the items in the current assessment through a concurrent calibration of the data from the current and previous assessments. In 2019, the TIMSS concurrent calibration consisted of combining TIMSS 2015 and TIMSS 2019 data from the trend countries; the 2019 data included the paperTIMSS data of the paperTIMSS trend countries and the bridge data of the eTIMSS trend countries.

In linking successive assessments, concurrent calibration relies on having a large proportion of trend items-items that are retained from one assessment to the next. The TIMSS assessment consists of 14 mathematics item blocks and 14 science item blocks at each grade. In TIMSS 2019, 6 of the mathematics blocks and 6 of the science blocks consisted of newly developed items. The remaining 8 mathematics blocks and 8 science blocks were carried forward from the TIMSS 2015 assessment and are the basis for linking TIMSS 2019 to the TIMSS achievement scales and maintaining trends over time. Exhibits 12.3 through 12.6 show the number of items present for the paperTIMSS 2019 concurrent calibration by item type and content and cognitive domain for both grades and subjects, respectively.

Exhibit 12.3: Mathematics Items for the paperTIMSS 2019 Concurrent Calibration—Grade 4

| Item Type | Points | Items Released in 2015 |  | Items Common in 2015 and 2019 |  | Items Introduced in 2019 |  | Total |  |

In concurrent calibration, item parameters for the current assessment are estimated based on the data from both the current and previous assessments, recognizing that some items (the trend items) are common to both. It is then possible to estimate the latent ability distributions of students in both assessments using the item parameters from the concurrent calibration. The difference between these two distributions is the trend measure between the previous and current assessments, although not yet on the TIMSS scale metric.

After the item calibration and estimation of student proficiency, the next step is to find the linear transformation that transforms the student ability distribution of the previous assessment data under the concurrent calibration to match the student ability distribution of these same data under the calibration that was done in the previous assessment. The final step entails applying this linear transformation to the current assessment data scaled using the concurrent calibration. This places the current assessment data on the TIMSS trend scale.

The paperTIMSS 2019 concurrent calibration model provided item parameter estimates for all paperTIMSS items. Using these 2019 item parameters, the TIMSS 2015 ability distribution was re-estimated across all trend countries to find the linear transformation that aligns that re-estimated 2015 student ability distribution with the original student ability distribution that was estimated in 2015. This linear transformation, applied to the 2019 paperTIMSS data and the bridge data, produced achievement results on the TIMSS trend scales. For the paperTIMSS countries, the resulting TIMSS 2019 achievement scores were used for reporting and publishing. The eTIMSS countries with bridge data obtained TIMSS 2019 achievement scores based on their bridge data, which served as a baseline for comparisons with their TIMSS 2019 results based on their eTIMSS data (see Chapter 13).

## Calibrating the paperTIMSS and Bridge Data

Item calibration was conducted by the TIMSS \& PIRLS International Study Center using the commercially available Parscale software (Muraki \& Bock, 1997) and included data from the TIMSS 2015 assessment and data from the TIMSS 2019 assessment, including bridge data, for countries that participated in both assessment cycles. The calibration used all available item response data from each country's student samples and from both the 2019 assessment and the 2015 assessment.

Exhibit 12.7 illustrates the general structure of the paperTIMSS 2019 concurrent calibration model to estimate the paperTIMSS item parameters. The upper panel of the exhibit, labelled "TIMSS 2015 calibration," represents the TIMSS 2015 data from the TIMSS 2019 trend countries and the student ability distribution, shown on the right, which was estimated for this population in the TIMSS 2015 scaling. The lower panel of Exhibit 12.7 is labelled "TIMSS 2019 Concurrent Calibration" and illustrates the full array of paperTIMSS data included in the TIMSS 2019 concurrent calibration model. This included the TIMSS 2015 data from all the TIMSS 2019 trend countries, as well as all 2019 data from paperTIMSS trend countries and bridge data from eTIMSS trend countries.

Exhibit 12.7: The paperTIMSS 2019 Concurrent Calibration Model

The 2019 concurrent calibration model included data from three trend countries that participated in the TIMSS 2019 fourth grade less difficult mathematics assessment. Their data contributed to the item parameter estimation for all fourth grade science items, as well as the 46 fourth grade mathematics items shared with the regular fourth grade mathematics assessment.

Exhibits 12.8 and 12.9 show the sample sizes for scaling the paperTIMSS 2019 data, both for item calibration and for proficiency estimation. Countries are shown as being either paperTIMSS (pT), eTIMSS bridge ( Br ), or less difficult (LD). All student samples were weighted so that each country contributed equally to the item calibration. This was particularly important for the smaller bridge samples of eTIMSS trend countries to ensure their equal contribution in the item calibration.

| TOTAL | 133,243 | 218,461 | 156,695 | 218,461 |

Countries are shown as being either paperTIMSS (pT) or eTIMSS bridge (Br).

At the fourth grade, 44 countries contributed to the concurrent calibration, including three countries that participated in the fourth grade less difficult mathematics assessment. These 44 trend countries provided 239,467 students from the 2015 assessment and 132,481 students from the 2019 assessment, including bridge data from eTIMSS trend countries. At the eighth grade, 33 countries contributed to the concurrent calibration, 218,461 students from the 2015 assessment and 133,243 students from the 2019 assessment, including bridge data from eTIMSS trend countries.

The item parameters estimated from these concurrent calibrations, based on the countries that participated in both the previous and current assessments, were used to estimate student proficiency for all countries and benchmarking entities participating in the paperTIMSS 2019 and bridge assessments. These item parameters also were used to estimate student proficiency in the mathematics and science content and cognitive domains. Estimating student proficiency for all eTIMSS countries and benchmarking participants based on their eTIMSS data also relied, to a large extent, on these estimated paperTIMSS item parameters.

At the fourth grade, paperTIMSS and bridge student proficiency was estimated for a total of 45 countries, as shown in Exhibit 12.8. At the eighth grade, student proficiency was estimated for 36 countries and 2 benchmarking participants, as shown in Exhibit 12.9. The item parameters estimated from the paperTIMSS concurrent calibration at the fourth and eighth grades and for mathematics and science are presented in Appendices 12A through 12D.

## Variables for Conditioning the paperTIMSS and Bridge Data

Conditioning refers to utilizing a latent regression model that involves all available students' contextual information to improve statistical properties of the estimated student proficiency values. Ideally, all student-level contextual data would be included in the conditioning model, but because TIMSS has so many student context variables that could be used in conditioning, the TIMSS \& PIRLS International Study Center follows the practice established by NAEP and followed by other large-scale studies of using principal component analysis to reduce the number of variables while explaining most of their common variance. Principal components for the TIMSS student context variables (including parent context variables at the fourth grade) were constructed as follows:

- For categorical variables (questions with a small number of fixed response options), a dummy coded variable was created for each response option, with a value of one if the option is chosen and zero otherwise. If a student omitted or was not administered a particular question, all dummy coded variables associated with that question were assigned the value zero.
- Context variables with numerous response options (such as year of birth) were recoded using criterion scaling. ${ }^{2}$ This was done by replacing the response option with the mean interim achievement score of all students choosing that option. Criterion scaling maximizes

2 The process of generating criterion-scaled variables is described in Beaton (1969).
the correlation between the scaled variable and achievement. For TIMSS, the interim achievement score was the student-level average of the mathematics and science EAP scores produced from the item calibrations.

- Separately for each country, all the dummy-coded and criterion-scaled variables were included in a principal component analysis. Those principal components accounting for 90 percent of the variance of all context variables were retained for use as conditioning variables. ${ }^{3}$ Because the principal component analysis was performed separately for each country and benchmarking participant, different numbers of principal components were required to account for 90 percent of the common variance in each country's context variables.

In addition to the principal components, students' gender (dummy coded), the language of the test (dummy coded), an indicator of the classroom in the school to which a student belongs (criterion scaled), and an optional country-specific variable (dummy coded) were included as primary conditioning variables, thereby accounting for most of the variance between students and preserving the betweenclassroom and within-classroom variance structure in the latent regression conditioning model. Exhibits 12.10 and 12.11 provide details on the conditioning models used for proficiency estimation of the paperTIMSS and bridge data at the fourth and eighth grades, respectively. percentage of variance accounted for to avoid over-specification of the conditioning model. This constraint played a major role with the eTIMSS bridge samples due to their smaller size.

## Generating Plausible values for the paperTIMSS and Bridge Data

Educational Testing Service's MGROUP program (Sheehan, 1985) was used to estimate the latent regression model and generate plausible values. This program takes as input the students' responses to the items they were given, the item parameters estimated at the calibration stage, and the conditioning variables, and generates as output the estimated regression effects and residual variance covariance, as well as plausible values that represent the posterior distribution of student proficiency given achievement and contextual data. A useful feature of MGROUP is its ability to estimate multi-dimensional latent regression models using the responses to all items across the proficiency scales and the correlations among the scales to improve the reliability of each individual scale. TIMSS capitalizes on this feature to estimate simultaneously overall mathematics proficiency and overall science proficiency at each grade using a two-dimensional MGROUP model. More details on the latent regression model are available in Chapter 11 of this volume.

The multi-dimensional scaling feature of MGROUP also was used to generate plausible values for the TIMSS 2019 content and cognitive domains. The estimation of plausible values for the mathematics and science content and cognitive domains relied on multidimensional IRT models using the item parameters estimated for the overall mathematics and overall science scales as well as the same set of conditioning variables. At the fourth grade, the content domain scaling used two four-dimensional models, one to estimate plausible values for the three content domains in mathematics with overall science and a second for the three science content domains with overall mathematics. At the eighth grade, the content domain scaling required two five-dimensional models because of the four content domains in each subject along with the other overall subject. The cognitive domain scaling relied on four four-dimensional models to estimate the three cognitive domains in mathematics and science, along with the other overall subject, at both fourth and eighth grades. All of these models were applied to each paperTIMSS country and benchmarking participant.

In addition to generating plausible values on the overall mathematics and science scales for the 2019 paperTIMSS and bridge data, the item parameters estimated at the calibration stage also were used to generate plausible values for the TIMSS 2015 assessment data for the countries included in the concurrent calibration at the fourth and eighth grades. These additional plausible values were used to establish the linear transformation necessary to place the paperTIMSS and bridge 2019 data on the appropriate TIMSS trend scales.

## Transforming the Overall Scores to Measure Trends

To provide results for the TIMSS 2019 assessments on the existing TIMSS achievement scales, the 2019 plausible values for overall mathematics and overall science had to be transformed to the TIMSS reporting metric. This was accomplished through a set of linear transformations as part of the concurrent calibration approach. These linear transformations were given by:

$$
\begin{equation*}
P V_{i k}^{*}=A_{i k}+B_{i k} \times P V_{i k} \tag{12.1}
\end{equation*}
$$

where
$P V_{i k}$ is the TIMSS 2019 plausible value $i$ of scale $k$ prior to transformation;
$P V_{i k}^{*}$ is the TIMSS 2019 plausible value $i$ of scale $k$ after transformation; and $A_{i k}$ and $B_{i k}$ are the linear transformation constants.

The linear transformation constants were obtained by first computing the international means and standard deviations of the plausible values for the overall mathematics and science scales using the plausible values produced in 2015 based on the 2015 item calibrations for the trend countries. These were the plausible values published in 2015. Next, the same calculations were done using the plausible values from the re-scaled TIMSS 2015 assessment data based on the 2019 paperTIMSS and bridge concurrent item calibrations for the same set of trend countries. From these calculations, the linear transformation constants were defined as:

$$
\begin{gather*}
B_{i k}=\sigma_{i k} / \sigma_{i k}^{*}  \tag{12.2}\\
A_{i k}=\mu_{i k}-B_{i k} \cdot \mu_{i k}^{*} \tag{12.3}
\end{gather*}
$$

where
$\mu_{i k}$ is the international mean of scale $k$ based on plausible value $i$ published in 2015;
$\mu_{i k}^{*}$ is the international mean of scale $k$ based on plausible value $i$ from the 2015 assessment based on the
2019 concurrent calibration;
$\sigma_{i k}$ is the international standard deviation of scale $k$ based on plausible value $i$ published in 2015;
$\sigma_{i k}^{*}$ is the international standard deviation of scale $k$ based on plausible value $i$ from the 2015 assessment
based on the 2019 concurrent calibration.
There are five sets of transformation constants for each scale, one for each plausible value. The trend countries contributed equally to the calculation of these transformation constants. Exhibits 12.12 and 12.13 show the TIMSS 2019 transformation constants for both subjects at the fourth grade and eighth grade, respectively. These transformation constants were applied to overall mathematics, overall science, and their respective content and cognitive domains. They also were applied across all TIMSS 2019 assessments: paperTIMSS, eTIMSS, bridge, and science for the countries participating in the less difficult assessment.

## Evaluating Model Fit to the TIMSS Assessment Data

After scaling the TIMSS 2019 paperTIMSS and bridge data, extensive checks were performed to verify the fit of the IRT models applied to these data, in terms of item calibration, proficiency estimation, and link to the TIMSS trend reporting scales. One key method consisted of evaluating the fit of the estimated item characteristic curves to the empirical response data. A second critical method consisted of measuring the accuracy in re-estimating the TIMSS 2015 achievement results across the pool of trend countries, a crucial component in accurately reporting TIMSS 2019 results on the TIMSS trend scales. This involved quantifying the linking error between the 2015 and 2019 assessments.

## Item Characteristic Curves

Model fit was assessed by visually comparing the item response function curves generated using the item parameters estimated from the data with the empirical item response function curves calculated from the latent abilities estimated for each student that responded to an item. The empirical functions are
themselves based on an estimated latent ability distribution that uses the IRT model and are therefore also referred to item functions based on pseudo counts. When the empirical results for an item fall near the fitted curves, the IRT model for that item fits the data well and provides an accurate and reliable measurement of the underlying proficiency scale.

Plots of these response function curves are called item characteristic curves (ICC). The plots in Exhibits 12.14 and 12.15 show examples of the empirical and fitted item response functions for dichotomously scored (right/wrong) multiple-choice and constructed response items, respectively. In each plot, the horizontal axis represents the proficiency scale on the logit metric, and the vertical axis represents the probability of a correct response. The fitted curve based on the estimated item parameters is shown as a solid line, with the item slope parameter represented by the slope of the curve between the two inflexion points, the difficulty or location parameter represented by the point on the horizontal axis where the probability of a correct response is 50 percent, and, for multiple-choice items, a lower asymptote corresponding to the guessing parameter.

Empirical results based on pseudo counts are represented by circles. The empirical results are obtained by first dividing the logit proficiency scale into intervals of equal size and then counting the number of students responding to the item whose estimated latent abilities (EAP scores estimated by Parscale) fall in each interval. Then the proportion of students in each interval that responded correctly to the item is calculated. In the exhibits, the center of each circle represents this empirical proportion of correct responses. The size of each circle is proportional to the estimated number of students contributing to the empirical proportion correct in its corresponding interval.

Exhibit 12.14: Example Item Response Function for a Dichotomous Multiple-Choice Item from paperTIMSS 2019 Grade 8 Mathematics

Exhibit 12.15: Example Item Response Function for a Dichotomous Constructed-Response Item from paperTIMSS 2019 Grade 4 Science

Probability of a Correct Response for Estimated Proficiency
TIMSS 2019 Trend - 4th Grade Science - CLB
Location=SP12_12 Item=SP71222 $\mathrm{a}=0.906 \mathrm{~b}=0.231$

In addition to graphical model fit assessment, the fit of an item to the IRT model is quantified by the root mean square difference (RMSD) statistic. The RMSD is the square root of the average of squared differences (i.e., the area) between the empirical curve, shown as bubbles, and the fitted curve, shown as the straight line, weighted by the size of the empirical bubbles. The RMSD statistics for the items shown in exhibits 12.14 and 12.15 are 0.028 and 0.038 , respectively. RMSD values less than 0.1 were considered to indicate good fit.

The ICC plot in Exhibit 12.16 shows the empirical and fitted item response functions for a polytomous item (scored 0,1 , or 2 ). As for the dichotomous item plots above, the horizontal axis represents the proficiency scale in logits, but in this example the vertical axis represents the probability of having a response in a given response category. The fitted curves based on the estimated item parameters are shown as solid lines and the empirical results are represented by circles. The interpretation of the circles is the same as in Exhibits 12.14 and 12.15. The curve starting at the top left of the chart plots the probability of a score of zero on the item. This probability should always decrease as proficiency increases. The
bell-shaped curve shows the probability of a score of one point-partial credit, which should start low approaching zero for low-ability students, reaching a maximum for medium-ability students, and decreasing for high-ability students. The curve ending at the top right corner of the chart shows the probability of a score of two points-full credit, starting low for low-ability students and increasing as proficiency increases. For this particular item, the RMSD value is 0.035 , calculated from all three response curves.

Exhibit 12.16: Example Item Response Function for a Polytomous Constructed-Response Item from paperTIMSS 2019 Grade 4 Mathematics

Although a single set of item parameters was estimated for any given item in the concurrent calibration for 2019, trend items have two empirical curves, one for each assessment cycle. Plotting both empirical curves from 2019 and 2015 allowed for a visual inspection of the invariance of the item parameters between cycles; a key aspect of the link to the trend scale. Exhibit 12.17 shows the ICC for a paperTIMSS 2019 trend item, with its single fitted curve and two empirical curves: the blue bubbles represent the empirical curve based on the TIMSS 2015 response data, the red curve the empirical curve based on the TIMSS 2019 response data. Thus, for trend items, there are two RMSD values. The RMSD values for this particular item are 0.027 based on the 2015 data and 0.028 based on the 2019 data.

## Exhibit 12.17: Example Item Response Function for a Dichotomous Constructed-Response Trend Item from paperTIMSS 2019 Grade 8 Science

RMSD values were computed for all items included in the paperTIMSS 2019 concurrent calibrations. These values are shown in the item parameter exhibits of Appendices 12A through 12D. They are also presented graphically in Exhibits 12.18 through 12.21 for the fourth and eighth grades and for mathematics and science, respectively. In each exhibit, the items are sorted from smallest to largest RMSD values. For trend items with two RMSD values, the largest of the two determined the order. Across both grades and subjects, the vast majority of paperTIMSS items have RMSD values less than 0.04. All paperTIMSS items have RMSD values less than 0.10.

## Quantifying the Linking Error between 2015 and 2019

A key aspect of reporting the TIMSS 2019 results on the TIMSS trend scales is the ability to accurately re-estimate the TIMSS 2015 achievement results based on a concurrent calibration of the 2015 and 2019 data across a common set of trend countries. As described earlier, this re-estimation serves to establish the linear transformation that places the TIMSS 2019 results on the TIMSS trend scale. Although this transformation is set globally to match the overall mean and standard deviation across the trend countries, it also should achieve a good alignment of the 2015 results across calibrations for each individual trend country. The difference between a trend country's TIMSS 2015 achievement mean published back in 2015 and re-estimated in 2019 gives a good measure of quality of the link between the two assessments. The linking error is quantified by the standard error of difference, for each country and aggregated over the countries (see Martin, Mullis, Foy, Brossman, \& Stanco, 2012).

Exhibits 12.22 through 12.25 provide results on the linking error associated with the paperTIMSS 2019 results for the fourth and eighth grades and for mathematics and science, respectively. Across both grades and subjects, there was good agreement between the countries' published and re-estimated 2015 results. Only one country shows a statistically significant difference for eighth grade science. In the vast majority of cases, the differences are within one point and the standard errors rarely exceed 2 points.

Exhibit 12.22: Trend Linking Error for the paperTIMSS 2019 Grade 4 Mathematics Scale

A statistically significant difference
Linking error is the standard error associated with the difference. Standard errors are shown in parentheses.

## Scaling the Fourth Grade Less Difficult Mathematics Data

All 11 countries that participated in the TIMSS 2019 less difficult mathematics assessment required additional item calibration models to estimate appropriate item parameters and plausible values on the TIMSS trend scales. By its very nature, the less difficult mathematics assessment and the pool of countries that participated required special consideration. Although there were four mathematics item blocks shared with the regular fourth grade mathematics assessment, they proved to be more challenging to students than expected, and solely relying on these four blocks did not produce precise achievement results. Instead, linking the TIMSS 2019 less difficult mathematics assessment by including the data from the TIMSS Numeracy 2015 assessment provided a stronger design with eight shared mathematics item blocks. Item parameters were estimated using the concurrent calibration approach as described for paperTIMSS above, combining TIMSS Numeracy 2015 data from 7 countries and TIMSS 2019 less difficult mathematics data from 11 countries. Exhibit 12.26 shows the number of mathematics items present for the TIMSS 2019 less difficult mathematics concurrent calibration by item type and mathematics content and cognitive domain.

Exhibit 12.26: Mathematics Items for the TIMSS 2019 Grade 4 Less Difficult Concurrent Calibration

| Item Type | Points | Items Released in 2015 |  | Items Common in 2015 and 2019 |  | Items Introduced in 2019 |  | Total |  |

The fourth grade science assessment administered to these countries did not have a counterpart in the TIMSS Numeracy 2015 administration. Consequently, the scaling approach adopted for the science data relied entirely on the TIMSS 2019 data with fixed item parameters for trend items, as estimated from the regular fourth grade science item calibration, and allowing item parameters for the new science items to be estimated appropriately based on the 11 countries that participated in the less difficult assessment. Exhibit 12.27 shows the number of science items present for the TIMSS 2019 less difficult calibration by item type and science content and cognitive domain.

Exhibit 12.28 shows the sample sizes for scaling the TIMSS 2019 less difficult data, both for item calibration and for proficiency estimation. The mathematics concurrent calibration made use of all TIMSS 2019 data from 11 participating countries and 61,884 students, as well as all the TIMSS Numeracy 2015 data from 7 participating countries and 40,684 students. Three countries participated in both assessments—Kuwait, Morocco, and South Africa. The science calibration made use of the TIMSS 2019 data only.

The item parameters estimated from the TIMSS 2019 less difficult calibrations for mathematics and science are presented in Appendices 12E and 12F, respectively. Appendices 12E and 12F also include the RMSD values computed to measure item-model fit. These item parameters we used to estimate student proficiency in both mathematics and science for all countries participating in the TIMSS 2019 less difficult assessment. They also were used to re-estimate student mathematics proficiency in TIMSS Numeracy 2015 for the countries that participated in that assessment, which was necessary to set the linear transformation that placed the TIMSS 2019 less difficult mathematics proficiency results on the TIMSS fourth grade mathematics trend scale.

Scaling the TIMSS 2019 less difficult assessment also required conditioning to enhance the reliability of student plausible values using student and parent context variables, as described for paperTIMSS earlier. Exhibit 12.29 provides details on the conditioning models used for proficiency estimation of the TIMSS 2019 less difficult data. The conditioning models for the 2015 data were relevant only for estimating mathematics proficiency for the TIMSS Numeracy 2015 data.

Exhibit 12.29: Conditioning Models for the TIMSS 2019 Less Difficult Data

| Country | 2019 |  |  |  | TIMSS Numeracy 2015 |  |  |  |

| South Africa (5) | 3 | 563 | 320 | 90 | 3 | 533 | 301 | 90 |

Estimating fourth grade mathematics proficiency and science proficiency for the TIMSS 2019 less difficult data followed the same approach as the paperTIMSS 2019 fourth grade data described earlier, incorporating the TIMSS 2019 less difficult response data, item parameters, and conditioning models. A two-dimensional MGROUP model was used to estimate simultaneously overall mathematics proficiency and overall science proficiency. The same fourth grade multi-dimensional MGROUP models described for paperTIMSS were used to estimate proficiency in the fourth grade mathematics and science content and cognitive domains.

With respect to the TIMSS 2019 less difficult mathematics assessment, the item parameters estimated at the concurrent calibration stage also were used to generate mathematics plausible values for the TIMSS Numeracy 2015 assessment data. These TIMSS 2015 plausible values were used to establish the linear transformation necessary to place the TIMSS 2019 less difficult mathematics data on the appropriate TIMSS fourth grade mathematics trend scale. Setting this linear transformation was done in the same manner described earlier in equations (12.1) through (12.3). It required aligning the re-estimated TIMSS Numeracy 2015 student ability distribution with the TIMSS Numeracy 2015 ability distribution that was estimated and published back in 2015. This linear transformation was then applied to the TIMSS 2019 less difficult mathematics proficiency plausible values to place them on the TIMSS fourth grade mathematics trend scale. Exhibit 12.30 shows the transformation constants for the TIMSS 2019 less difficult mathematics assessment.

Exhibit 12.30: Transformation Constants for the TIMSS 2019 Less Difficult Mathematics Data

| PV4 | 398.59399 | 105.37049 | -0.04897 | 0.92428 | 404.17690 | 114.00325 |
| PV5 | 398.38464 | 105.37384 | -0.04913 | 0.92296 | 403.99395 | 114.16995 |

No additional linear transformation was required for the fourth grade science data from the TIMSS 2019 less difficult assessment. Because of the fixed item parameter scaling approach applied to the science data, the regular TIMSS 2019 fourth grade science linear transformation constants shown in the science panel of Exhibit 12.12 were used to place the science plausible values of the TIMSS 2019 less difficult assessment on the TIMSS 2019 fourth grade science trend scale.

## Scaling the eTIMSS Data

The main objective in this third phase of the scaling effort was to derive TIMSS 2019 student plausible values from the eTIMSS assessment data, suitable for reporting and publication, adjusting for any mode effect between the two assessment modes (see Chapter 11). The eTIMSS data and bridge data from the eTIMSS 2019 trend countries were submitted to a series of calibration models to estimate TIMSS 2019 student proficiency results from the eTIMSS assessment data relying on group equivalence between the eTIMSS and bridge samples and the presence of comparable items, that is, items that functioned equivalently under both modes of administration. Chapter 11 provides the conceptual framework and describes the models implemented and described in this section to address the presence of a mode effect.

Exhibits 12.31 through 12.34 show the numbers of items present in the eTIMSS 2019 calibrations by item type and content and cognitive domains for both grades and subjects. The bridge data consist of the paperTIMSS trend items. Consequently, the numbers for bridge items in Exhibits 12.31 through 12.34 match the numbers of trend items shown in Exhibits 12.3 through 12.6, respectively. They also match the numbers of eTIMSS trend items in their respective exhibits, with the exception of eighth grade science since one eTIMSS trend item (SE52134) was removed from scaling because it did not have suitable psychometric properties in its digital form (see Appendix 10E).

Exhibit 12.31: Mathematics Items for the eTIMSS 2019 Calibration—Grade 4

Exhibit 12.35 shows the sample sizes for scaling the fourth grade eTIMSS 2019 and bridge data, both for item calibration and for proficiency estimation. Twenty-seven countries contributed bridge and eTIMSS data to the item calibration and 30 countries and 6 benchmarking participants were included in proficiency estimation. Although Austria was not a trend country and did not contribute to the fourth grade paperTIMSS concurrent calibration, they administered the bridge booklets and thus were included in the fourth grade eTIMSS 2019 item calibration.

Exhibit 12.36 shows the sample sizes for scaling the eighth grade eTIMSS 2019 and bridge data, both for item calibration and for proficiency estimation. Eighteen countries contributed bridge and eTIMSS data to the item calibration and 22 countries and 5 benchmarking participants were included in proficiency estimation.

Hong Kong SAR, despite being a trend country and having administered the bridge booklets, was excluded from the eTIMSS item calibration at both grades due to inconsistent mode differences at both grades and subjects. The response differences in Hong Kong SAR were more pronounced for science at both grades, particularly at the eighth grade, which ran counter to the general pattern of other eTIMSS countries where mathematics showed larger mode differences (see Exhibit 13.6 in Chapter 13).

## Identifying Invariant Items

As described earlier, an item equivalence study was carried out before the TIMSS 2019 assessment (Fishbein et al., 2018). This study led to the expectation that around 80 percent of the trend items could be considered comparable in terms of presentation and item content. That is, a large proportion of trend items, after being adapted to the digital interface for computer delivery, were from a visual and response requirement perspective deemed comparable to their paper counterpart. To confirm this comparability assessment, the starting point for scaling the eTIMSS 2019 data was the application of an interim item calibration model that made no assumption about the presence of a difference in mode of administration, thus relying exclusively on the group equivalence between the eTIMSS and bridge samples (see Chapter 9 for information about the samples). Combining eTIMSS and bridge data from all eTIMSS trend countries, item parameters were estimated for all eTIMSS 2019 items and then compared to their paperTIMSS counterparts. This "full non-invariance model" served as a baseline to provide statistical evidence of item equivalence, or invariance, between both modes of administration.

From the outset, many TIMSS 2019 items were expected to have similar behavior in both modes of administration based on the item equivalence study, in particular trend items that had been designed for paper-based administration in past TIMSS assessments. Some of the new eTIMSS 2019 items designed to capitalize on the digital environment of computer-based assessments were not expected to behave the same (Fishbein et al., 2018). Extensive analyses of item percent correct statistics and IRT parameters between eTIMSS and paperTIMSS, as well as RMSD statistics for the difference between paperTIMSS and eTIMSS ICC curves determined that three response input types showed more similarity in psychometric properties between modes and could be further analyzed for item equivalence. Consequently, the identification of equivalent or invariant items focused on the three major item types whose student responses were expected to be similar in both modes of administration based on detailed examination of items: traditional multiple-choice items, keyboard items, and number pad items.

Finalizing the groups of equivalent items was achieved, first, by using a modified version of the Root Mean Square Difference (RMSD) statistic, as described earlier. In the context of the full noninvariance model, the RMSD statistic measured the difference between an item's two empirical item characteristic curves, one based on the paperTIMSS item response data (including bridge for trend items) and the other based on the eTIMSS item response data. Appendices 12 G through 12J show the item parameters estimated by the full non-invariance model for all eTIMSS items at both grades and both subjects, including the RMSD statistic for quantifying item invariance. ${ }^{4}$ Items from the three major item types with RMSD values less than 0.1 were deemed suitable to serve as anchor items between modes.

All other items, including items with other input types (e.g., not multiple-choice, keyboard, or number pad), were left as non-equivalent items to have item parameters freely estimated in the final model.

[^16]The group of equivalent items was further refined after estimating the adjusted model described below, where equivalent items had item parameters fixed to equal the paperTIMSS item parameters adjusted by a constant. After running the adjusted model, RMSD statistics for the fit of the empirical eTIMSS ICC curve to the theoretical eTIMSS ICC curve were examined. Any equivalent items with an RMSD greater than 0.1 were made non-equivalent for the subsequent model, so that, consistent with paperTIMSS, all eTIMSS items had good fit.

At the fourth grade, the full non-invariance model and resulting RMSD statistics identified 124 of 171 mathematics items as invariant. The results of the first adjusted model identified one item as having poor fit, resulting in 123 invariant items. In science, the full non-invariance model identified 148 of 169 items as invariant. The results of the first adjusted model identified one item as having poor fit, resulting in 147 invariant items. At the eighth grade, the full non-invariance model identified 170 of 206 mathematics items and 185 of 211 science items as invariant. In eighth grade mathematics, the first adjusted model identified three items as having poor model fit, resulting in 167 invariant items in the final model. In science, the adjusted model was estimated twice to finalize the invariant items-the first identified five poorly fitting items and the second identified two additional, resulting in 178 invariant items in the final model.

Exhibit 12.37 shows the numbers of equivalent and non-equivalent items in the final calibration models. The percentage of equivalent eTIMSS items ranged from 72 to 87 percent across fourth and eighth grades for mathematics and science. As could be anticipated, somewhat higher percentages of eTIMSS trend items were equivalent—ranging from 80 to 91 percent. Having a substantial percentage of equivalent items between paperTIMSS and eTIMSS strengthened the validity and interpretability of achievement results based on linking the two modes utilizing equivalent items as anchor, and estimating the mode adjustment based on the equivalence of the samples prior to mode assignment.

## Estimating International Mode Effect Parameters for Equivalent Items

Dealing effectively with the two modes of administration in TIMSS 2019 required applying an overall mode adjustment constant to the difficulty parameter of invariant eTIMSS items. An extensive examination of percent correct statistics of paper bridge and eTIMSS trend items revealed there was a small but significant average international difference favoring paper bridge in each subject at both grades, with a smaller difference in science than mathematics (see Exhibit 13.6 in Chapter 13). These observed international mode differences required accounting for in the eTIMSS achievement results using an international adjustment of the invariant item parameters. While non-invariant eTIMSS items had distinct item parameters estimated for them, invariant items inherited the item parameters of their paperTIMSS counterparts with their location, or difficulty, parameter shifted by an international mode effect parameter to account for the average international difference (the international mode effect) between the paper and eTIMSS versions. Chapter 11 provides a description of how this adjustment is based on a simple extension of IRT models that utilizes the features of customary IRT linking methods.

Estimating an international mode effect parameter for each grade and subject was done using a weighted mean mode transformation. Simply stated, this adjustment parameter is the difference of the mean location parameters between the paper-based and computer-based versions of the eTIMSS items that were deemed invariant. The weighting factor assigned to each invariant eTIMSS item was the amount of information present in the two location parameters, quantified by the inverse of the two location parameter estimation error variances.

For each grade and subject combination, the international mode effect parameter $\delta_{m}$ was estimated over all invariant items $(i=1, \ldots, N)$ as follows:

$$
\begin{equation*}
\delta_{m}=\frac{\sum_{i=1}^{N} w_{i}\left(b_{e T, i}-b_{p T, i}\right)}{\sum_{i=1}^{N} w_{i}} \tag{12.4}
\end{equation*}
$$

where
$b_{e T, i}$ is the estimated computer-based location parameter for invariant item $i$;
$b_{p T, i}$ is the estimated paper-based location parameter for invariant item $i$;
and the weight factor $w_{i}$ is as follows:

$$
\begin{equation*}
w_{i}=\frac{1}{S D\left(b_{e T, i}\right)^{2}+S D\left(b_{p T, i}\right)^{2}} \tag{12.5}
\end{equation*}
$$

where
$\mathrm{SD}\left(b_{\text {eT,i }}\right)$ is the estimated standard deviation of the computer-based location parameter for invariant item $i$; and
$\mathrm{SD}\left(b_{p T, i}\right)$ is the estimated standard deviation of the paper-based location parameter for invariant item $i$.
Thus, the shifted location parameter $b_{i}^{*}$ for invariant item $i$ was calculated as follows:

$$
\begin{equation*}
b_{i}^{*}=b_{i}+\delta_{m} \tag{12.6}
\end{equation*}
$$

Exhibit 12.38 shows the four estimated international mode effect parameters. The paper-based location parameters and their standard deviations were estimated from the paperTIMSS concurrent calibrations and are shown in Appendices 12A through 12D. The computer-based location parameters and their standard deviations were estimated from the eTIMSS full non-invariance calibration models and are shown in Appendices 12G through 12J.

Exhibit 12.38: eTIMSS 2019 Estimated International Mode Effect Parameters

|  | Mode Effect <br> Parameter |  |
| :--- | :--- | :---: |
| Grade 4 | Mathematics | 0.09342 |
| Grade 8 | Science | 0.05894 |
|  | Mathematics | 0.10983 |
|  | Science | 0.06766 |

## eTIMSS 2019 Final Item Calibration

In the final eTIMSS 2019 item calibration models, which combined bridge and eTIMSS data, item parameters for the bridge items were fixed at their values from the paperTIMSS concurrent calibrations. Item parameters for eTIMSS items found to be invariant also were fixed at the values of their paperTIMSS counterparts with an additional international mode effect parameter estimated for each grade and subject added to the location parameters as shown in equation (12.6). Finally, item parameters for the remaining eTIMSS items-found to be non-invariant, i.e., affected by mode differences-were estimated freely. Appendices 12 K through 12 N show the item parameters for all eTIMSS 2019 items based on the final calibration models. These appendices include RMSD statistics to quantify model fit. All RMSD values are less than 0.10 , the vast majority are less than 0.05 , indicating good model fit.

## Generating Plausible Values for the eTIMSS Data

Estimating student plausible values for the eTIMSS 2019 data followed the same general approach as for the paperTIMSS 2019 data. Conditioning was used to enhance the psychometric properties of student plausible values using student and parent context variables, as described for paperTIMSS earlier. Exhibits 12.39 and 12.40 provide details on the conditioning models used for proficiency estimation at the fourth grade and eighth grade, respectively.

Mathematics proficiency and science proficiency for the eTIMSS 2019 data at both grades were estimated using the same psychometric models as for the paperTIMSS 2019 data, as described earlier in this chapter, incorporating the eTIMSS 2019 response data, item parameters, and conditioning models. A two-dimensional MGROUP model was used to estimate simultaneously overall mathematics proficiency and overall science proficiency. The same paperTIMSS multi-dimensional MGROUP models were used to estimate proficiency in the mathematics and science content and cognitive domains at both grades.

Because the eTIMSS 2019 item calibrations were anchored to the paperTIMSS concurrent calibrations via the bridge items, the scale transformations calculated and applied to the paperTIMSS data, as shown in Exhibits 12.12 and 12.13, were appropriate for placing the estimated eTIMSS 2019 student plausible values in mathematics and science on the TIMSS trend scales. These scale transformations also were applied to the eTIMSS 2019 mathematics and science plausible values in the content and cognitive domains at both grades.

## Conclusion

Scaling the TIMSS 2019 achievement data was successful in estimating plausible values from its paperTIMSS and eTIMSS assessments, including the less difficult mathematics assessment at the fourth grade. The psychometric methods implemented and described in this chapter relied on past experience for scaling the paperTIMSS data. Scaling the eTIMSS data required careful consideration of any potential mode effect, which was dealt with effectively with the use of a paper bridge assessment administered in eTIMSS trend countries. The conceptual framework and mode effect models for linking the paperTIMSS and eTIMSS achievement data are described in Chapter 11.

The major outcome was the successful linking of all TIMSS 2019 assessments to the TIMSS trend scales such that results from the paper-based and the computer-based 2019 assessments can be compared directly without further need for adjustments. They also can be compared reliably with past TIMSS assessments. The high levels of comparability of the item parameters between modes of administration was established, and the mode-adjusted item parameters can be used in the population model to generate plausible values for estimating group level results and to examine the relation between the constructs of interest and additional variables. Chapter 13 provides valuable insight into the comparability of achievement results between both modes of administration.

## Appendix 12F: Science Item Parameters from the TIMSS 2019 Grade 4 Less Difficult Calibration

## Item

RMSD Slope $\left(a_{i}\right) \quad$ Location $\left(b_{i}\right)$
Guessing ( $\mathrm{c}_{\mathrm{i}}$ )
Step $1\left(d_{i 1}\right)$
Step $2\left(\mathrm{~d}_{\mathrm{i} 2}\right)$

## CHAPTER 13

## Examining eTIMSS Country Differences Between eTIMSS Data and Bridge Data A Look at Country-Level Mode of Administration Effects

Matthias von Davier<br>Pierre Foy<br>Michael O. Martin Ina V.S. Mullis

The TIMSS \& PIRLS International Study Center made every effort to ensure a seamless transition from the TIMSS paper-and-pencil format to the new, computer based eTIMSS. A major priority in developing the TIMSS 2019 assessment was ensuring that the eTIMSS and paperTIMSS assessments measured the same mathematics and science constructs, using the same items as much as possible.

## The TIMSS 2019 Bridge Between eTIMSS and paperTIMSS

The purpose of this chapter is to help each eTIMSS country understand how a comparison between its eTIMSS data and its bridge data can be used to study how the transition to eTIMSS may have affected its TIMSS 2019 achievement results.

Based on an item equivalence pilot in 2017 (Fishbein, Martin, Mullis, \& Foy, 2018) that indicated a modest mode of administration effect, countries transitioning to eTIMSS included a bridge to paperTIMSS to control for this mode effect. To provide bridging data, eTIMSS countries administered the complete computer-based eTIMSS 2019 assessment as well as a smaller, paper-based version of the trend items. That is, eTIMSS countries re-administered their eight blocks of trend items from 2015 in paperTIMSS format. The bridge booklets were administered to an additional sample of 1,500 students, sampled from about one-third of the schools selected for the full eTIMSS sample. As a random sample from the same student population, the bridge sample taking the trend items in paperTIMSS format is randomly equivalent to the full eTIMSS sample. As such, the bridge data form an intermediate link between eTIMSS countries' computer-based data in 2019 and their paper-based data in 2015, as well as to the paperTIMSS countries in 2019.

Using the bridge data as a link between paperTIMSS and eTIMSS is an example of equivalent groups linking. Because students were randomly assigned to the new (eTIMSS) and old (paperTIMSS) formats of an assessment, the students taking the two formats could be expected to have the same underlying skills and knowledge. They differ only in that they were randomly assigned to different formats and are otherwise equivalent. Underlying this approach is the principle of randomization, one of the central principles of experimental design (Box, Hunter, \& Hunter, 2005), which aims to ensure that observed differences in results of groups exposed to experimental treatments are due to the treatments themselves and not to pre-existing differences between the groups.

## Item Equivalence Between eTIMSS and paperTIMSS

TIMSS 2019 paid particular attention in converting its paper trend items (items used in TIMSS 2015 and retained in the 2019 assessment) to the eTIMSS computer-based version to ensure as much comparability as possible between response modes. This resulted in a large number of trend items that were very similar in presentation and response format between the paper and the eTIMSS assessments. In developing new items, there was an effort to capitalize on the digital environment and produce more engaging item types.

Having a substantial percentage of equivalent items between paper and eTIMSS strengthens the validity and interpretability of achievement results based on linking the two modes and enhances the randomly equivalent groups design. The more similarity between the paper and computer-based items, the more achievement differences between them are likely to be due to a mode effect. Therefore, TIMSS 2019 devoted considerable effort to identifying items that were equivalent or invariant with respect to paper and eTIMSS format, in content and psychometric properties (see Chapter 12; von Davier et al., 2019a,b).

Exhibit 13.1 shows the counts of equivalent and non-equivalent items in eTIMSS 2019 at fourth grade and eighth grade for mathematics and science. The percentage of equivalent trend items ranged from 80 to 91 percent across fourth and eighth grades for mathematics and science. Moreover, high percentages of all the eTIMSS items were equivalent-ranging from 72 to 87 percent. The equivalent items come from the following three categories defined by response types: multiple choice, keyboard, or number pad. As could be anticipated, somewhat higher percentages of the trend items were equivalent compared to the new items.

Exhibit 13.1: eTIMSS 2019 Achievement Items by Mode of Administration Equivalence eTIMSS 2019 Fourth Grade Item Equivalence

| Item Type | Mathematics |  |  |  | Science |  |  |

## Country-Level Differences in Average Percent Correct on TIMSS 2019 Trend Items by Mode of Administration

To help users of the TIMSS 2019 data gain an understanding of the effect of changing from paperTIMSS to eTIMSS, the analyses in this section compare average performance between the paper bridge and eTIMSS on the trend items. This approach provides a model for investigating country mode effects for different types of items or student groups and a useful avenue for beginning to explore a country's transition to eTIMSS. The computations are described in Appendix 13A and are relatively straightforward.

Although the approach could be applied to any group of items, the analyses below were restricted to the more than 80 percent of the trend items that were found to be invariant between the two modes (see Exhbibit 13.1). These items are virtually identical except for administration mode, and the two samples were designed to be randomly equivalent. Apart from sampling differences and deviations from the sampling design that have caused some departure from this equivalence of comparison groups, the performance differences between the paper bridge and eTIMSS can be attributed to a mode effect.

Exhibits 13.2 through 13.5 show for each eTIMSS country average performance on the invariant trend items for the paper bridge and eTIMSS samples as well as the average across the countries. Exhibits 13.2 and 13.3 show the results for fourth grade mathematics and science. Exhibits 13.4 and 13.5 show the same for eighth grade mathematics and science.

| International Average | 47.81 (0.27) | 45.72 (0.16) |

( ) Standard errors appear in parentheses.
Exhibit 13.6 shows the international average percent correct across countries for the invariant trend items for the paper bridge and eTIMSS as well as the difference between them, together with their standard errors. At both fourth and eighth grades, there was a small but significant average international difference favoring the paper bridge in each subject, with a smaller difference in science than mathematics. These international mode effects require an international adjustment for each subject and grade before country differences can be properly evaluated.

## Exhibit 13.6: eTIMSS 2019 International Average Percent Correct on Paper Bridge and eTIMSS Invariant Items

| Grade 4 | Bridge | eTIMSS | Difference |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Mathematics | $53.42(0.23)$ | $50.77(0.13)$ | $2.65(0.26)$ | $\mathbf{A}$ |
| Science | $51.51(0.20)$ | $49.69(0.11)$ | $1.82(0.23)$ | $\mathbf{A}$ |
| Grade 8 | Bridge | eTIMSS | Difference |  |
| Mathematics | $47.37(0.33)$ | $43.72(0.18)$ | $3.66(0.38)$ | $\mathbf{A}$ |
| Science | $47.81(0.27)$ | $45.72(0.16)$ | $2.09(0.31)$ | $\mathbf{A}$ |

( ) Standard errors appear in parentheses.
© indicates the bridge students performed significantly higher than the eTIMSS students ( $\alpha=0.05$ ).

Exhibits 13.7 and 13.8 show for fourth grade mathematics and science the country mode differences between the paper bridge and eTIMSS data, having adjusted for the average international differences. The country deviations from the international percent correct (difference between country average percent correct and the international average percent correct) are shown for the paper bridge and eTIMSS, together with their standard errors. For example, Austria's deviation for the bridge was 1.41 (0.94) and for eTIMSS was $2.10(0.56)$. The relative difference for the country is the difference between the two deviations, e.g., -0.69 for Austria, which is not significant. The relative difference represents the country mode difference adjusted for the average international difference between modes (see Appendix 13A).

Exhibit 13.7: eTIMSS 2019 Country Deviations from International Average Percent Correct for Paper Bridge and eTIMSS Invariant Items and their Differences - Fourth Grade Mathematics

| Country | Bridge | eTIMSS | Difference |  |
| :---: | :---: | :---: | :---: | :---: |
| Austria | 1.41 (0.94) | 2.10 (0.56) | -0.69 (1.09) |  |
| Canada | -5.54 (1.04) | -4.53 (0.49) | -1.01 (1.15) |  |
| Chile | -21.45 (0.96) | -20.85 (0.52) | -0.60 (1.09) |  |
| Chinese Taipei | 18.51 (0.68) | 19.12 (0.42) | -0.61 (0.80) |  |
| Croatia | -6.18 (0.90) | -6.52 (0.53) | 0.34 (1.04) |  |

( ) Standard errors appear in parentheses.
A indicates the bridge students performed significantly higher than the eTIMSS students ( $\alpha=0.05$ ).
$\nabla$ indicates the bridge students performed significantly lower than the eTIMSS students $(\alpha=0.05)$.

Exhibits 13.7 through 13.10 provide a way to evaluate whether countries had positive or negative mode effects over and above the international effect. Although most differences were not statistically significant given their standard errors, there were some differences, mostly small. Also, when computing a large number of significance tests, some number ( $5 \%$ or so) will appear statistically significant just by means of random sampling variability rather than underlying mode differences.

The estimated differences observed when looking at a relatively large number of country-mean differences follow a statistical distribution around the 'true' differences. Some are smaller and some are larger, and should the exercise be repeated, and another set of bridge and eTIMSS samples collected,
a country's difference most likely would be slightly lower or slightly higher. This is the well-known 'regression to the mean' effect, whereby if one repeats a data collection the observations showing the most extreme estimates in the original study may not show as extreme estimates in the replication (e.g. Efron, 2011).

## Country-Level Differences in TIMSS 2019 Average Scale Scores (Plausible Values) by Mode of Administration

As a consequence of the eTIMSS-paperTIMSS linking approach used in the achievement scaling, the eTIMSS scale scores and bridge scale scores are on the same TIMSS 2019 achievement scales and can be directly compared. However, the eTIMSS scale scores are based on all of the 2019 achievement items, while the bridge scale scores are based on only the trend items and were estimated from samples one-third the size of eTIMSS. For each grade and subject, the item parameters from the paperTIMSS trend scaling were applied to the eTIMSS data with a small constant adjustment to account for the average international difference (the international mode effect) between the paper and eTIMSS versions (see Chapter 12; von Davier et al., 2019a,b). Thus, country differences in scale scores between the eTIMSS and paper bridge data are the result of country mode effects and sampling differences.

Exhibits 13.11 and 13.12 show average country differences between average eTIMSS and paper bridge scale scores for fourth grade mathematics and science.

| International Average | 522 | (1.2) | 523 | (1.0) | 0 | (1.6) |  |

( ) Standard errors appear in parentheses.
A indicates the bridge students performed significantly higher than the eTIMSS students ( $\alpha=0.05$ ).
$\nabla$ indicates the bridge students performed significantly lower than the eTIMSS students ( $\alpha=0.05$ ).

Exhibits 13.11 and 13.12 show that the differences for grade 4 are mostly non-significant. The only country with significant results in both mathematics and science was Georgia, where students taking eTIMSS had lower achievement than those taking the paper bridge. In Portugal, the students taking the eTIMSS appear to perform lower in mathematics compared to the bridge but not in science. In the Netherlands, students taking eTIMSS performed better in mathematics, but there was no difference in science. In Sweden, Austria, and Canada, the students taking eTIMSS performed better in science than those who took the bridge, while there was no difference in mathematics.

Exhibits 13.13 and 13.14 show for eighth grade mathematics and science the comparisons of bridge and eTIMSS samples in terms of achievement estimates (plausible values) based on the randomly equivalent groups.

| International Average | 516 (1.6) | 513 (0.8) | 3 (1.8) |  |

( ) Standard errors appear in parentheses.
© indicates the bridge students performed significantly higher than the eTIMSS students ( $\alpha=0.05$ ).
$\nabla$ indicates the bridge students performed significantly lower than the eTIMSS students ( $\alpha=0.05$ ).

As shown in Exhibits 13.13 and 13.14, the differences for the eighth grade are mostly non-significant. In Sweden, students taking eTIMSS performed lower in mathematics, but there was no difference in science. In Hong Kong SAR and Qatar, students taking eTIMSS performed lower in science than those who took the bridge, while there was no difference in mathematics. In Italy and Lithuania, the eTIMSS students performed higher in science than the bridge students.

Exhibits 13.11 through 13.14 show a small number of significant differences between eTIMSS and the paper bridge. Of the few countries with mode differences, they were either in mathematics or in science and occurred in both directions, with the exception of a paper bridge advantage for Georgia at the
fourth grade. Also, these exhibits contain a total of 94 mode comparisons, 56 for fourth grade and 38 for eighth grade, and we have not made adjustments for multiple comparisons (e.g. Shaffer, 1995; Benjamini \& Hochberg, 1995). About 5 significant differences would be expected to occur purely at random among 94 comparisons at the $\alpha=0.05$ level.

## Summary

The present chapter provides an overview of how countries can use their bridge data together with their eTIMSS data to evaluate the extent of mode differences in their TIMSS 2019 data. First, to provide an accessible approach to the study of country mode effects, country differences in the average percent correct between the paper bridge and eTIMSS were examined for those trend items found to be equivalent. Then, after subtracting the average international difference from the country average for both the bridge and eTIMSS, the difference between the bridge and eTIMSS country deviations provides an estimate of the country mode effect. However, only a few countries had significant mode effects, and these were for most countries isolated instances of one subject in one grade.

Second, country differences between average eTIMSS scale scores and scale scores estimated for the paper bridge were examined. Similar to the results from the percent correct analyses, country differences in average scale scores between eTIMSS and the paper bridge were small, and few were flagged as statistically significant. Because the bridge scale scores were based on smaller samples and fewer items than the eTIMSS scale scores, these differences may be due to sample differences in addition to residual differences that were present in the linked scales.

This chapter is intended to encourage researchers interested in examining how mode effects can differ among countries, types of items, or student groups. More in depth studies by country experts may be worthwhile to explore to what extent differences in performance between paper bridge and eTIMSS can be attributed to residual mode effects versus sample differences.

## Appendix 13A

## Comparing Country Level Proportion Correct to International Averages

Consider the international average of a statistic, for example an average proportion correct over a number of item responses. In our case, these are the items that were designed for a paper based assessment, TIMSS 2015, and that were still used in TIMSS 2019 as trend items for computer based countries, and were re-implemented for computer delivery for countries that chose to use the eTIMSS assessment. These trend items were carefully designed for computer delivery so that a majority of $80 \%$ or more per grade and subject domain was considered equivalent in terms of how they relate to achievement on the TIMSS scale.

The international average of the average percent-correct typically based on equal contribution of all participating countries, that is, they are defined as an unweighted average. Formally, we have

$$
\mu_{I}=\frac{1}{C} \sum_{c=1}^{C} \mu_{c} .
$$

Obviously, we do not have the true population values at the country level, as we only collect a sample of schools, and 1 or 2 classrooms per school. The best estimate of the country average percentages are the weighted estimates of the proportion correct, i.e., the weighted sum of correct responses, divided by the sum of weights, over the items that are considered comparable.

The international estimate $\widehat{M}_{I}$ of this proportion correct has estimation error as well, as it is also based on sampling, albeit over multiple countries. We denote the standard error associated with this average by $\widehat{S}_{I}$. Assuming unbiased sample-based estimates, we have

$$
E\left(\widehat{M}_{I}\right)=E\left(\sum_{c=1}^{c} \widehat{M}_{c}\right)=\mu_{I}
$$

with estimates of country means $\widehat{M}_{c}$ that are based on the country sample, we also assume these are unbiased, i.e.,

$$
E\left(\widehat{M}_{c}\right)=\mu_{c}
$$

and denote the associated standard errors by $\widehat{S}_{c}$. For an estimate of the difference, $\widehat{d}_{k}=\widehat{M}_{k}-\widehat{M}_{I}$ of a country $k$ 's mean and overall mean $\Delta_{k}=\mu_{k}-\mu_{I}$ we observe the following complication. The estimate of the international mean $\widehat{M}_{I}$ contains the country mean $\widehat{M}_{k}$ as one component. This implies

$$
\hat{S}_{d(k)}=\sqrt{\hat{S}_{I}^{2}+\hat{S}_{k}^{2}-2 \operatorname{cov}\left(\widehat{M}_{I}, \widehat{M}_{k}\right)}
$$

with

$$
\operatorname{cov}\left(\widehat{M}_{I}, \widehat{M}_{k}\right)=\operatorname{cov}\left(\frac{1}{C} \sum_{c=1}^{C} \widehat{M}_{c}, \widehat{M}_{k}\right)=\frac{1}{C} \operatorname{cov}\left(\widehat{M}_{k}, \widehat{M}_{k}\right)=\frac{1}{C} \hat{S}_{k}^{2} .
$$

Plugging this result into the estimate provides

$$
\hat{S}_{d(k)}=\sqrt{\hat{S}_{I}^{2}+\hat{S}_{k}^{2}-\frac{2}{C} \hat{S}_{k}^{2}}=\sqrt{\hat{S}_{I}^{2}+\left[\frac{C-2}{C}\right] \hat{S}_{k}^{2}}
$$

which is well defined whenever there are at least two countries, i.e., whenever $C \geq 2$.

## Country Mode Differences, Corrected for International Mode Differences

The international estimate and the expected values of proportion correct of paper items (' P '-samples) will be denoted by

$$
E\left(\widehat{M}_{I P}\right)=\mu_{I P}
$$

and the mean of proportion correct across computer based (' E '-samples) is

$$
E\left(\widehat{M}_{I C}\right)=\mu_{I E}
$$

Similarly, we have associated standard errors for the estimate of the international proportion correct for paper, $S_{I P}$, and computer, $S_{I E}$, respectively, as we have for the country level estimates $S_{k P}$ and $S_{k E}$. These can be calculated separately using the jackknife procedures and defined as given above. The bridge and the eTIMSS samples do provide an estimate $\widehat{d}_{P-E}$ of the mode difference

$$
\Delta_{P-E}=\mu_{I P}-\mu_{I E}
$$

at the international level. This mode difference is being controlled for in the linking design that uses the bridge and eTIMSS samples in a customary equivalent groups approach. That means this difference is no longer relevant and can be taken out of country level comparisons of the effect of mode on achievement results. Only any remaining differences that are based on differences at the country levels are relevant, as the overall difference is no longer affecting the plausible values that are provided in the international database.

That means, in order to examine whether there is a difference between the paper- and the eTIMSS proportion correct at the country-level that goes beyond what would be expected internationally. Only differences that go beyond this are relevant, as the international average of correct response differences is already taken care of by the mode effect adjustment. Consequently, the difference

$$
\widehat{d}_{P k-E k}=\widehat{d}_{P k}-\widehat{d}_{E k} \approx \widehat{M}_{P k}-\widehat{M_{E k}}-\Delta_{P-E}
$$

quantifies the relative paper versus eTIMSS difference of proportions correct that not accounted for by the international linking in the bridge study. For this estimated difference, we can use the standard error

$$
\hat{S}_{P k-E k}=\sqrt{\hat{S}_{P d(k)}+\hat{S}_{E d(k)}}
$$

With the estimates defined as above

$$
\hat{S}_{P d(k)}=\sqrt{\hat{S}_{I P}^{2}+\left[\frac{C-2}{C}\right] \hat{S}_{k P}^{2}}
$$

and

$$
\hat{S}_{E d(k)}=\sqrt{\hat{S}_{I E}^{2}+\left[\frac{C-2}{C}\right] \hat{S}_{k E}^{2}} .
$$

Note that these are almost the same as the s.e. for the country mean proportions correct for paper versus eTIMSS, calculated separately. This statistic is adjusted by the s.e. for the international proportion correct (separately calculated by mode) but adjusted for the number of countries included in the international mean proportions.

## Achievement data comparisons based on Bridge and eTIMSS samples

The comparison, once the linking is accomplished, is rather straightforward. The standard error estimates for the bridge sample averages and the eTIMSS averages can be used to calculate the standard error of the difference for countries where schools were selected to test either using the paperTIMSS or the eTIMSS assessment. These can, within countries, be assumed to be independent samples, and if the schools were randomly assigned to the mode of assessment, these independent samples can be assumed to be identically distributed. In practice, this may not be completely true, as schools that were able to test on computer may have been somewhat different from schools that were assigned to test with the bridge/ paperTIMSS instruments. For example, hardware availability in schools may be associated with average socio-economic status of students' parents.

Assuming independent samples from the same population, the mean difference

$$
\mu_{c B}-\mu_{c E}=\Delta
$$

Between bridge sample (B) and eTIMSS sample (E) in country c can be evaluated using the standard error of the difference for independent samples,

$$
\text { s.e. }(\Delta)=\sqrt{\text { s.e. }\left(\mu_{c B}\right)^{2}+\text { s.e. }\left(\mu_{c E}\right)^{2}} \text {. }
$$

However, this is no longer appropriate and may overestimate the s.e. if students were assigned to paper or eTIMSS within schools. In this case, samples are dependent, and the difference of the achievement per school needs to be calculated and the variance of this difference needs to be estimated using an appropriate resampling method (Efron, 1979). The bridge and the eTIMSS samples would in some countries be drawn in the same schools, but different classes, while in other countries the two samples would come from schools without overlap, while a third set of countries would have some schools that assign one class to paperTIMSS and another to eTIMSS, and other schools would only assign one class to one of the modes. The assumption of independent samples is applicable in the case that the different classes perform independently of being sampled in the same or in different schools. If schools are very different compared to between class differences within schools (i.e., there is tracking between schools, but little tracking within schools) this will lead to overestimation of standard errors.

In the exhibits, we assume for simplicity of exposition, we assume independent samples of students taking the eTIMSS and the paperTIMSS assessment.

## CHAPTER 14

## Estimating Standard Errors in the TIMSS 2019 Results

Pierre Foy
Sylvie LaRoche

To obtain estimates of students' proficiency in mathematics and science that are both accurate and costeffective, TIMSS 2019 made extensive use of probability sampling techniques to sample students from the national fourth and eighth grade student populations, and applied matrix-sampling assessment designs to target individual students with a subset of the complete pool of assessment items. This approach made efficient use of resources, in particular keeping student response burden to a minimum, but at a cost of some variance or uncertainty in the reported statistics, such as the means and percentages computed to estimate population parameters.

To quantify this uncertainty, each statistic in the TIMSS 2019 international report is accompanied by an estimate of its standard error. Statistics based on differences arising from comparing two estimated results also have standard errors, which serve to calculate confidence intervals or to perform statistical tests of significance. For statistics reporting student achievement, which are based on plausible values, standard errors are calculated based on two components. The first reflects the uncertainty due to generalizing from a student sample to the entire student population from which it was drawn, referred to as sampling variance. The second is known as imputation variance and reflects uncertainty due to inferring students' achievement estimates from their observed performance on a subset of achievement items and other achievement related information. This variance component reflects the posterior variance of the achievement variables given all available information used in the achievement imputation model described in Chapter 11 of this volume. For parameter estimates of variables that are not plausible values, the estimates of standard errors are based entirely on sampling variance.

## Estimating Sampling Variance

TIMSS makes extensive use of probability sampling to derive achievement results from national samples of students. Because many such samples are possible but only one sample is drawn, some uncertainty about
how well the sample represents the population is to be expected. The uncertainty caused by sampling students from a target population, known as sampling variance, can be estimated from the data of the one sample drawn.

Whereas estimating the sampling variance from simple random samples is a relatively simple task, estimating the sampling variance from the complex sample design of TIMSS is a more challenging endeavor. A common way to estimate the sampling variance in multistage cluster sampling designs is through resampling schemes (Efron, 1982) such as the balanced repeated replication and Jackknife techniques (Johnson \& Rust, 1992; Quenouille, 1949; Tukey, 1958; Wolter, 1985). TIMSS uses a variation of the Jackknife, Jackknife Repeated Replication (JRR), to estimate sampling variances. JRR was chosen because it is computationally straightforward and provides approximately unbiased estimates of the sampling variance of means, totals, and percentages.

At the core of the JRR technique is the repeated resampling from the one sample drawn, under identical sample design conditions. In the context of TIMSS, this entails the grouping of primary sampling units into sampling zones based on the TIMSS sample design and repeated draws of subsamples from these zones. The main features of the TIMSS sample design that JRR incorporates in its repeated replication are the stratification of schools and the clustering of students within schools. This was done by defining Jackknife sampling zones as pairs of successive schools ${ }^{1}$ to model the stratification and clustering from the national samples (see Chapter 3 for information on the TIMSS Sample Design). The repeated subsampling required by JRR was applied within each sampling zone.

Sampling zones were constructed within explicit strata. When an explicit stratum had an odd number of schools, either by design or because of non-responding schools, the students in the lone school of the last sampling zone were divided randomly to make up two "quasi" schools for the purposes of calculating jackknife standard errors. ${ }^{2}$ Each sampling zone then consisted of a pair of schools or "quasi" schools. Since most national samples consisted of a minimum of 150 schools, a total of 75 zones were created. If more than 150 schools were sampled, the additional zones were collapsed into the first 75 zones. ${ }^{3}$

Exhibit 14.1 shows the number of constructed Jackknife sampling zones, prior to any collapsing, for the participating countries and benchmarking participants in TIMSS 2019. ${ }^{4}$

The JRR procedure draws two subsamples from each sampling zone: one where the first school in the pair is included and the second school is removed, and the other where the second school is included and the first school is removed. When a school is removed from a sampling zone, the sampling weights of the students in the remaining school are doubled to make up for the omitted school. In both subsamples, all students in the other sampling zones are included with their sampling weights unchanged. With this process applied in each of the 75 sampling zones, the JRR procedure yields a total of 150 replicate subsamples, each one with its own set of replicate sampling weights to account for the successive removal of each school from the pair of schools in any given sampling zone.

The process of creating replicate sampling weights for the replicate subsamples defines replicate factors $k_{h i}$ as follows:

$$
k_{h i}=\left\{\begin{array}{l}
2 \text { for students in school } i \text { of sampling zone } h  \tag{14.1}\\
0 \text { for students in the other school of sampling zone } h \\
1 \text { for students in any other sampling zone }
\end{array}\right.
$$

These replicate factors are used to compute the 150 sets of replicate sampling weights as follows:

$$
\begin{equation*}
W_{h i j}=k_{h i} \cdot W_{0 j} \tag{14.2}
\end{equation*}
$$

where $W_{0 j}$ is the overall sampling weight of student $j$ and $W_{h i j}$ is the resulting replicate sampling weight of student $j$ when school $i$ from sampling zone $h$ is included and the other school in the pair is removed.

Exhibit 14.2 illustrates the calculation of the replicate factors necessary to produce the replicate sampling weights. Within each sampling zone, each school is assigned randomly an indicator $u_{h i}$, coded either 0 or 1 , such that one school has a value of 0 and the other a value of 1 . This indicator serves to determine how schools within each zone will be successively included and removed. When a school is removed from a zone, the replicate factor is set to 0 and the sampling weights of all students in that school are set to 0 . When a school is included, the replicate factor is set to 2 and the sampling weights of
all students in that school are doubled. The sampling weights of students in all the other sampling zones remain unchanged.

Exhibit 14.2: Construction of Replicate Factors Across Sampling Zones

| Sampling Zone | School Replicate Indicator ( $u_{h i}$ ) | Replicate Factors for Computing JRR Replicate Sampling Weights ( $\mathrm{k}_{\mathrm{hi}}$ ) |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Zone 1 |  | Zone 2 |  | Zone 3 |  |  | Zone h |  |  | Zone 75 |  |
|  |  | (1) | (2) | (3) | (4) | (5) | (6) |  | (2h-1) | (2h) |  | (149) | (150) |
| 1 | 0 | 2 | 0 | 1 | 1 | 1 | 1 | $\cdots$ | 1 | 1 | . | 1 | 1 |
|  | 1 | 0 | 2 |  |  |  |  |  |  |  |  |  |  |
| 2 | 0 | 1 | 1 | 2 | 0 | 1 | 1 | . . | 1 | 1 | . | 1 | 1 |
| 2 | 1 |  |  | 0 | 2 |  |  |  |  |  |  |  |  |
|  | 0 | 1 | 1 | 1 | 1 | 2 | 0 | $\ldots$ | 1 | 1 | . . | 1 | 1 |
|  | 1 |  |  |  |  | 0 | 2 |  |  |  |  |  |  |
| : | : | : | : | : | $\vdots$ | : | : | - | : | : | : | : | : |
|  | 0 | 1 | 1 | 1 | 1 | 1 | 1 | . . | 2 | 0 |  | 1 | 1 |
|  | 1 |  |  |  |  |  |  |  | 0 | 2 |  |  |  |
| : | : | : | $\vdots$ | : | : |  |  | : | : | : | $\bullet$. | : | $\vdots$ |
| 75 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | $\ldots$ | 1 | 1 |  | 2 | 0 |
|  | 1 |  |  |  |  |  |  |  |  |  |  | 0 | 2 |

For example, sampling Zone 1 yields two sets of replicate sampling weights, hence the two columns for Zone 1 . The first set has doubled sampling weights $\left(k_{11}=2\right)$ for the students in the first school $\left(u_{11}=0\right)$ of Zone 1 , zeroed sampling weights $\left(k_{12}=0\right)$ for the students in the second school $\left(u_{12}=1\right)$ of Zone 1 , and unchanged sampling weights ( $k_{h i}=1$ ) for all students in the other sampling zones, e.g., Zones 2 through 75. This is shown in the first Zone 1 column. The second set of replicate sampling weights (shown in the second Zone 1 column) has zeroed sampling weights $\left(k_{11}=0\right)$ for the students in the first school ( $u_{11}=0$ ) of Zone 1 , doubled sampling weights $\left(k_{12}=2\right)$ for the students in the second school $\left(u_{12}=1\right)$ of Zone 1 , and unchanged sampling weights ( $k_{h i}=1$ ) for all students in the other sampling zones.

The process is repeated across all 75 possible sampling zones, generating 150 sets of replicate sampling weights. The replicate sampling weights are then used to estimate any statistic of interest 150 times. The variation across these 150 jackknife estimates determines the sampling variance.

Given a statistic to be computed from a national sample, the formula used to estimate the sampling variance of that statistic, based on the TIMSS JRR algorithm, is given by the following equation:

$$
\begin{equation*}
\operatorname{Var}_{j r r}\left(t_{0}\right)=\frac{1}{2} \sum_{h=1}^{75} \sum_{i=1}^{2}\left(t_{h i}-t_{0}\right)^{2} \tag{14.3}
\end{equation*}
$$

where the term $t_{0}$ denotes the statistic of interest estimated with the overall student sampling weights $W_{0 j}$ and the term $t_{h i}$ denotes the same statistic computed using the set of replicate sampling weights $W_{h i j}$ obtained from sampling zone $h(h=1, \ldots, 75)$, where the $i^{\text {th }}$ school $\left(1^{\text {st }}\right.$ or $\left.2^{\text {nd }}\right)$ in the zone is included and the other removed., where the school ( $1^{\text {st }}$ or $\left.2^{\text {nd }}\right)$ in the zone is included and the other removed. Efron (1982) provides a proof of why the variance can be calculated based on these squared deviations of the $t_{h i}$ from the total sample statistics in jackknife based resampling schemes.

The sampling variance estimated with the TIMSS JRR method properly accounts for the variation arising from having sampled students using the TIMSS 2019 multi-stage stratified cluster sample design. Its square root is used as the standard error for any statistic derived from variables other than plausible values. Examples of such statistics include the mean age of students, the percentage of students with at least one parent with a university degree, and other variables that can be assessed objectively and likely only minimally affected by response variability.

## Estimating Imputation Variance

For variables other than plausible values, standard errors were the result solely of sampling variation, and were computed using the JRR technique. However, the situation with achievement estimates is more complex. Achievement estimates are based on observations of how students perform on a subset of the TIMSS 2019 items. As described in the TIMSS 2019 Assessment Frameworks, the TIMSS 2019 item pool was far too extensive to be administered in its entirety to any one student, and a matrix-sampling assessment design was adopted whereby each student was given a single test booklet containing only a part of the entire assessment. The results from all students and booklets were then analyzed using item response theory to provide estimates of achievement on the TIMSS 2019 scale. Any estimate of achievement based on a set of observed variables is affected by measurement error. In order to generalize to the full assessment, an imputation (Rubin, 1987) model that incorporates performance on TIMSS 2019 of each student as well as information about similarities between students was applied. This imputation model is a latent regression model described in Chapter 11 of this volume and was used to derive estimates of student performance (plausible values). Student proficiency estimates incorporate uncertainty that can be quantified through measurement error and variability due to the latent regression. TIMSS 2019 followed the customary procedure of generating five imputations, or plausible values, for each student and using the variability among them as a measure of that uncertainty, known as the imputation variance.

The general procedure for estimating the imputation variance when analyzing student achievement data follows the basic principle of performing any statistical analysis five times-once for each set of plausible values-and aggregating the five sets of results (Mislevy, Beaton, Kaplan, \& Sheehan, 1992). Thus, for any given achievement-based statistic $t$, estimating that statistic from each plausible value yields
five estimates $t_{m}, m=1, \ldots, 5$, all of them computed using the overall student sampling weights $W_{0 j}$. The final estimate of that statistic, $t_{0}$, is the average of these five estimates:

$$
\begin{equation*}
t_{0}=\frac{1}{5} \sum_{m=1}^{5} t_{m} \tag{14.4}
\end{equation*}
$$

The imputation variance of the statistic $t_{0}$ is simply the variance of the five results from the plausible values, computed as follows:

$$
\begin{equation*}
\operatorname{Var}_{i m p}\left(t_{0}\right)=\frac{6}{5} \sum_{m=1}^{5} \frac{\left(t_{m}-t_{0}\right)^{2}}{4} \tag{14.5}
\end{equation*}
$$

where the factor $\frac{6}{5}$ is a correction factor required by the multiple imputation methodology (Rubin, 1987). This imputation variance is then added to the sampling variance to produce the total variance estimate of the statistic $t_{0}$, as follows:

$$
\begin{equation*}
\operatorname{Var}_{t o t}\left(t_{0}\right)=\operatorname{Var}_{j r r}\left(t_{0}\right)+\operatorname{Var}_{i m p}\left(t_{0}\right) \tag{14.6}
\end{equation*}
$$

The sampling variance $\operatorname{Var}_{j r r}\left(t_{0}\right)$ in this context is the average of the sampling variances from the five plausible values $\operatorname{Var}_{j r r}\left(t_{m}\right) m=1, \ldots, 5$, as follows:

$$
\begin{equation*}
\operatorname{Var}_{j r r}\left(t_{0}\right)=\frac{1}{5} \sum_{m=1}^{5} \operatorname{Var}_{j r r}\left(t_{m}\right) \tag{14.7}
\end{equation*}
$$

where

$$
\begin{equation*}
\operatorname{Var}_{j r r}\left(t_{m}\right)=\frac{1}{2} \sum_{h=1}^{75} \sum_{i=1}^{2}\left(t_{m h i}-t_{m}\right)^{2} \tag{14.8}
\end{equation*}
$$

and $t_{m h i}$ is the appropriate JRR estimate for plausible value and computed using the set of replicate sampling weights of sampling zone $h$ where school $i$ is included. The square root of the total variance is then the proper standard error for any statistic based on plausible values, such as the average TIMSS mathematics achievement for girls, or the percentage of students at or above the TIMSS Advanced International Benchmark of mathematics achievement.

Appendices 14A through 14D provide details on the jackknife sampling variance, the imputation variance, the total variance, and the overall standard error for each country's mean proficiency estimates in mathematics at the fourth grade, science at the fourth grade, mathematics at the eighth grade, and science at the eighth grade, respectively, and including the content and cognitive domains. Appendices 14 E and 14 F provide the same details for the bridge samples, limited to overall mathematics and science. ${ }^{5}$

5 Information on the bridge samples is available in Chapter 3.

## Estimating Standard Errors for International Averages

Some exhibits in the TIMSS 2019 international report include international averages and their standard errors. For example, Exhibit 1.5 of TIMSS 2019 International Results in Mathematics and Science reports the international average for the percentages of girls and boys and their fourth grade mathematics achievement. International averages are computed using the data from the participating countries included in the main table of an exhibit. Results from the benchmarking participants are not included in the estimation of international averages.

For any given statistic $t_{0}$, its international average is given by

$$
\begin{equation*}
t_{i n t l}=\frac{1}{N} \sum_{k=1}^{N} t_{0 k} \tag{14.9}
\end{equation*}
$$

where $N$ is the number of countries contributing to the international average and $t_{0 k}$ is the estimate of our statistic of interest for country $k$.

The total variance of the international average $t_{\text {intl }}$ is given by

$$
\begin{equation*}
\operatorname{Var}_{\text {tot }}\left(t_{\text {intt }}\right)=\frac{1}{N^{2}} \sum_{k=1}^{N} \operatorname{Var}_{\text {tot }}\left(t_{0 k}\right) \tag{14.10}
\end{equation*}
$$

where $\operatorname{Var}_{t o t}\left(t_{0 k}\right)$ is the total variance of our statistic of interest for country $k$. For statistics based on plausible values, the total variance includes the sampling variance and the imputation variance, as given in equation (14.6) above. For statistics not based on plausible values, such as percentages, the total variance is based entirely on the sampling variance, as shown in equation (14.3) above. The standard error of the international average is the square root of the total variance.

## Estimating Standard Errors for Comparing Independent Results

Standard errors, along with providing a measure of uncertainty for TIMSS results, also serve to perform statistical test of significance when comparing two or more results. A basic objective of TIMSS is to provide fair and accurate comparisons of student achievement across TIMSS assessment cycles. Exhibit 1.4 in the TIMSS 2019 International Results in Mathematics and Science report is one such example, showing fourth grade mathematics trend comparisons for the TIMSS 2019 countries across the TIMSS assessment cycles. The reports also include comparisons of results across the participating countries. Exhibit 1.2 shows all pairwise country comparisons for fourth grade mathematics achievement. All of these comparisons and their statistical significance tests require the computation of a standard error for a difference between two comparable results.

TIMSS 2019 results were reported by way of a statistic such as a mean or percentage, and each statistic is accompanied by its standard error, computed using either equation (14.3) or equation (14.6), as appropriate. When comparing results, either between assessment cycles or between countries, it is necessary to compute the standard error of the difference between two results. Because national samples are drawn independently of each other within an assessment cycle, as well as between assessment cycles, computing the standard error of a difference is straightforward.

When computing the difference between two TIMSS results $t_{A}$ and $t_{B}$ on the same TIMSS scale, which could be comparing the science achievement of countries $A$ and $B$, or the science achievement of a country between assessment cycles $A$ and $B$, the standard error of that difference is given by

$$
\begin{equation*}
S E\left(t_{A}-t_{B}\right)=\sqrt{\operatorname{Var}_{\text {tot }}\left(t_{A}\right)+\operatorname{Var}_{\text {tot }}\left(t_{B}\right)} \tag{14.11}
\end{equation*}
$$

or, more simply

$$
\begin{equation*}
S E\left(t_{A}-t_{B}\right)=\sqrt{S E\left(t_{A}\right)^{2}+S E\left(t_{B}\right)^{2}} \tag{14.12}
\end{equation*}
$$

which can be stated as follows: the standard error of the difference between two independent results is the square root of the sum of their respective squared standard errors.

## Estimating Standard Errors for Comparing Dependent Results

In the context of TIMSS, dependent results are statistics derived from the same national, or benchmarking, sample. The achievement difference between girls and boys, as shown in Exhibit 1.5 in the TIMSS 2019 International Results in Mathematics and Science report, is an example of two dependent results and their difference. This dependence occurs because girls and boys are selected from the same sample of classrooms and schools. Girls and boys from the same school tend to perform more similar as compared to subgroups selected from different schools, thus inducing a correlation that needs to be accounted in the computation of the standard error of their performance difference.

The difference between two statistics is itself a statistic. With this in mind, the standard error of any difference between two dependent results is computed in the same way as any other statistic, as was described earlier. The 150 sets of replicate weights produce 150 replicate estimates of the difference of interest and equations (14.3) and (14.6) apply.

## Estimating Standard Errors for Comparing Against International Average

In TIMSS 2019 international report exhibits showing international averages, it can be of interest to compare a country's results to its corresponding international average. Exhibit 1.10.1 is one such example, showing percent correct statistics for a fourth grade mathematics item anchored at the TIMSS Low International Benchmark, along with a statistical significance test for comparisons of national results with the international average.

When comparing a country's result with the international average, TIMSS accounts for the fact that the country contributed to the international standard error. To correct for this contribution, the standard error of the difference needs to be adjusted. The total variance of the difference $t_{k}-t_{i n t l}$, comparing country $k$ to the international average for a statistic $t$, is given by

$$
\begin{equation*}
\operatorname{Var}_{\text {tot }}\left(t_{k}-t_{\text {intt }}\right)=\operatorname{Var}_{\text {tot }}\left(t_{\text {intt }}\right)+\frac{(N-1)^{2}-1}{N^{2}} \operatorname{Var}_{\text {tot }}\left(t_{k}\right) \tag{14.13}
\end{equation*}
$$

where $N$ is the number of countries contributing to the international average, $\operatorname{Var}_{\text {tot }}\left(t_{\text {intl }}\right)$ is the total variance of the international average as computed by equation (14.10), and $\operatorname{Var}_{\text {tot }}\left(t_{k}\right)$ is the total variance for country $k$ as computed by equation (14.6).

Equation (14.13) can be simplified and expressed in terms of standard errors as follows

$$
\begin{equation*}
S E\left(t_{k}-t_{\text {int }}\right)=\sqrt{S E\left(t_{\text {int }}\right)^{2}+\frac{N-2}{N} S E\left(t_{k}\right)^{2}} \tag{14.14}
\end{equation*}
$$

where $\operatorname{SE}\left(t_{\text {intl }}\right)$ is the standard error of the international average and $\operatorname{SE}\left(t_{k}\right)$ is the standard error for country $k$.

## CHAPTER 15

# Using Scale Anchoring to Interpret the TIMSS 2019 Achievement Scales 

Ina V.S. Mullis
Bethany Fishbein

## Introduction

As described in Chapter 12: Implementing the TIMSS 2019 Scaling Methodology, the TIMSS 2019 achievement results are summarized using item response theory (IRT) scaling. Countries' average achievement scores are reported on the TIMSS achievement scales for mathematics and science, with most average achievement scores ranging from 300 to 700 . Average achievement provides data users with information about how achievement compares among countries and whether scores are improving or declining over time.

To provide as much information as possible for policy and curriculum reform, however, it is important to describe the mathematics and science competencies associated with different locations within the range of scores on the achievement scales. For example, in terms of levels of proficiency in mathematics and science, what does it mean for a country to have average achievement of 513 or 426, and how different are these scores?

The TIMSS 2019 International Benchmarks provide information about what students know and can do at different points along the achievement scales. More specifically, TIMSS has identified four points along the achievement scales to use as international benchmarks of achievement—Advanced International Benchmark (625), High International Benchmark (550), Intermediate International Benchmark (475), and Low International Benchmark (400). For each assessment and International Report, the TIMSS \& PIRLS International Study Center works with the expert international committee that guides assessment development, Science and Mathematics Item Review Committee (SMIRC), to conduct a scale anchoring analysis to describe student competencies at the TIMSS International Benchmarks.

This chapter describes the scale anchoring procedures that were applied to update the descriptions of student performance at the international benchmarks from TIMSS 2015 to TIMSS 2019. The analysis
was conducted separately for mathematics and for science at fourth and eighth grades. In brief, scale anchoring involved conducting a scale anchoring analysis to identify items that students scoring at the international benchmarks answered correctly, and then having experts examine the content of each item to determine the kind of knowledge, skill, or reasoning demonstrated by students who responded correctly to the item. The experts then summarized the detailed list of item competencies in a brief description of achievement at each international benchmark. Thus, the scale anchoring procedure yielded a content-referenced interpretation of the achievement results that can be considered in light of the TIMSS 2019 frameworks for assessing mathematics and science.

## Classifying the Items

As the first step, students scoring within 5 scale-score points of each benchmark (i.e., the benchmark point plus or minus 5) were identified for the benchmark analysis. This 10-point range provided an adequate sample of students scoring at the benchmark, and yet was small enough so that performance at one international benchmark was still distinguishable from the next. The score ranges around each international benchmark and the number of students scoring in each range are shown in Exhibit 15.1.

Exhibit 15.1: Range Around Each TIMSS 2019 International Benchmark and Number of Students Within Each Range

|  |  | $\begin{aligned} & \text { Low } \\ & (400) \end{aligned}$ | Intermediate (475) | $\begin{aligned} & \text { High } \\ & (550) \end{aligned}$ | Advanced (625) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Range of Scale Scores |  | 395-405 | 470-480 | 545-555 | 620-630 |
| Grade 4 Mathematics (includes Less Difficult) | eTIMSS | 3,255 | 6,798 | 8,222 | 4,248 |
|  | paperTIMSS | 3,876 | 6,310 | 6,485 | 3,140 |
|  | Less Difficult | 3,792 | 3,718 | 1,905 | 428 |
|  | Total | 10,923 | 16,826 | 16,612 | 7,816 |
| Grade 4 Science | eTIMSS | 2,899 | 6,738 | 8,939 | 4,297 |
|  | paperTIMSS | 3,513 | 6,062 | 6,736 | 2,805 |
|  | Total | 6,412 | 12,800 | 15,675 | 7,102 |
| Grade 8 Mathematics | eTIMSS | 2,918 | 4,700 | 4,513 | 2,617 |
|  | paperTIMSS | 4,468 | 4,464 | 3,513 | 1,831 |
|  | Total | 7,386 | 9,164 | 8,026 | 4,448 |
| Grade 8 Science | eTIMSS | 2,485 | 4,531 | 5,066 | 3,092 |
|  | paperTIMSS | 3,676 | 4,412 | 3,990 | 2,032 |
|  | Total | 6,161 | 8,943 | 9,056 | 5,124 |

paperTIMSS sample sizes include bridge samples from eTIMSS countries.
Data analysis was conducted before achievement scaling completely finalized.

The second step involved computing the percentage of those students scoring in the range around each international benchmark that answered each item correctly. To compute these percentages, students in each country were weighted proportionally to the size of the student population in the country. For multiple-choice items and constructed response items worth 1 point, it was a straightforward matter of computing the percentage of students at each benchmark who answered each item correctly. For constructed response items scored for partial and full credit, percentages were computed for students receiving partial credit (1-point) as well as for students receiving full credit (2-points). Because the students in about half the countries took the items in the eTIMSS format and the other half in the paper format, first the percent corrects were computed separately for computer-based and paper, including the bridge data. A comparison showed these to be very similar (recall that the detailed comparison between modes found more than $80 \%$ of the items to be mode invariant, see Chapter 12). So for most the items, the two percentages, one for computer-based and one for paper, were averaged for the scale anchoring analysis. For the remaining 20 percent or fewer items with differences in the percentages between the eTIMSS and paper format, the eTIMSS percentage was used as the better bridge to future assessments.

Third, the criteria described below were applied to identify the items that anchored at each benchmark. An important feature of the scale anchoring method is that it yields descriptions of the performance demonstrated by students reaching each of the international benchmarks on the scales, and that the descriptions reflect demonstrably different accomplishments by students reaching each successively higher benchmark. Because the process entails the delineation of sets of items that students at each international benchmark are likely to answer correctly and that discriminate between one benchmark and the next, the criteria for identifying the anchor items considers performance at adjacent benchmarks.

For multiple-choice items, 65 percent answering correctly was used as the criterion for anchoring at each benchmark being analyzed, since students would be likely (about two-thirds of the time) to answer the item correctly. In addition, a criterion of less than 50 percent was used for the next lower benchmark, because with this response probability, students were more likely to have answered the item incorrectly than correctly. A somewhat less strict criterion was used for the constructed response items, because students had much less scope for guessing. For constructed response items, the criterion of 50 percent answering correctly was used for the benchmark without any discrimination criterion for the next lower benchmark.

Using a multiple-choice items as an example, the criteria for each benchmark are outlined below:

- A multiple-choice item anchored at the Low International Benchmark (400) if at least 65 percent of students scoring in the range around the Low International Benchmark (395405) answered the item correctly. Because this was the lowest benchmark described, there were no further criteria.
- A multiple-choice item anchored at the Intermediate International Benchmark (475) if at least 65 percent of students scoring in the range answered the item correctly, and less than 50 percent of students at the Low International Benchmark answered the item correctly.
- A multiple-choice item anchored at the High International Benchmark (550) if at least 65 percent of students scoring in the range answered the item correctly, and less than 50 percent of students at the Intermediate International Benchmark answered the item correctly.
- A multiple-choice item anchored at the Advanced International Benchmark (625) if at least 65 percent of students scoring in the range answered the item correctly, and less than 50 percent of students at the High International Benchmark answered the item correctly.

To include all of the multiple-choice items in the anchoring process and provide information about content domains and cognitive processes that might not otherwise have been represented by many anchor items, the concept of items that "almost anchored" was introduced. These were items that met slightly less stringent criteria for being answered correctly. The criteria to identify multiple-choice items that "almost anchored" were that 60 to 65 percent of students scoring in the range answered the item correctly and less than 50 percent of students at the next lowest benchmark answered the item correctly. To be completely inclusive for all items, items that met only the criterion that 60 to 65 percent of the students answered correctly (regardless of the performance of students at the next lower point) were also identified. The categories of items were mutually exclusive, and ensured that all of the items were available to inform the descriptions of student achievement at the anchor levels. A multiple-choice item was considered to be "too difficult" to anchor if less than 60 percent of students at the advanced benchmark answered the item correctly. A constructed response item was considered to be "too difficult" to anchor if less than 50 percent of students at the advanced benchmark answered the item correctly.

Exhibit 15.2 presents the number of TIMSS 2019 mathematics and science items that anchored at each international benchmark. A description of the items for mathematics at the fourth grade, science at the fourth grade, mathematics at the eighth grade, and science at the eighth grade can be found in Appendices $15 \mathrm{~A}, 15 \mathrm{~B}, 15 \mathrm{C}$, and 15 D , respectively. It should be noted that a partial credit item can anchor twice, typically at a higher benchmark for full credit ( 2 of 2 points), and a lower benchmark for partial credit ( 1 of 2 points), but sometimes both anchored at the same level. Only the full credit anchoring results were used to write the benchmark descriptions. For the mathematics scale anchoring at the fourth grade, TIMSS took advantage of data from the less difficult assessment items in developing the descriptions for the Low and Intermediate Benchmarks.

Exhibit 15.2: Number of Items Anchoring and Almost Anchoring at Each TIMSS 2019 International Benchmark

| Content Domain | $\begin{aligned} & \text { Low } \\ & (400) \end{aligned}$ | Intermediate (475) | High <br> (550) | Advanced (625) | Above Advanced | Total |

* Grade 4 Mathematics includes less difficult items at the Low and Intermediate Benchmarks.

## Writing the Scale Anchoring Descriptions

Due to COVID-19, an online scale anchoring for TIMSS 2019 was conducted in the spring of 2020, instead of an in-person meeting of the Mathematics and Science SMIRC. In preparation for review by SMIRC, staff at the TIMSS \& PIRLS International Study Center used examples from previous assessments to draft short descriptions of the student competencies demonstrated by a correct (or partially correct) response to each mathematics and science item. Then, the mathematics and science items were organized separately by grade, grouped by international benchmark, and within each benchmark the items were sorted by content area. The final categorization was by the anchoring criteria the items met-items that
anchored, followed by items that almost anchored, then by items that met only the 60 to 65 percent criteria. Also, in addition to the short draft descriptions, the following information was included for each item: framework classification, answer key or scoring guide, secure status, percent correct at each benchmark, and overall international percent correct. Beyond the item-by-item descriptions and anchoring data, SMIRC members were given the benchmark descriptions from TIMSS 2015.

The members of SMIRC committee 1) worked through each item to review/revise the description of the student competencies demonstrated by a correct (or a partially correct) response, 2) updated the TIMSS 2015 summaries of the proficiency demonstrated by students reaching each international benchmark for publication in the TIMSS 2019 report, and 3) selected example items from TIMSS 2019 that supported and illustrated the benchmark descriptions to illustrate the types of items answered correctly by students at each of the four benchmarks..

Following the SMIRC review, the descriptions and example items were included in the TIMSS 2019 International Report for review by the TIMSS 2019 National Research Coordinators at their $8^{\text {th }}$ meeting in July 2020 (scheduled for Prague, but held virtually).

## Appendix 15A: Grade 4 Mathematics Item Descriptions Developed During the TIMSS 2019 Benchmarking

| Number | Items at Low International Benchmark (400) |
| :--- | :--- |
| N01_02 | Solves a word problem involving subtraction of a one-digit number from a two-digit <br> number |
| N01_05 | Multiplies a one-digit number by a two-digit number |
| N03_01 | Orders four three-digit numbers |
| N03_02 | Solves a word problem involving division of a two-digit number by a one-digit number |
| N03_03A | Identifies the largest of four three-digit numbers in context |
| N05_01 | Identifies a four-digit number represented in words |
| N07_03 | Solves a word problem involving subtraction of a one-digit number from a three-digit <br> number |
| N07_04 | Writes a number between two two-digit numbers |
| N09_02 | Solves a word problem involving addition of two two-digit numbers |
| N11_02 | Solves a word problem involving addition of two- and three-digit numbers |
| N11_04 | Multiplies a three-digit number by a one-digit number |
| N12_01 | Identifies the smallest of four four-digit numbers |
| N12_02 | Identifies a multiple of a one-digit number |
| N13_01 | Adds two two-digit numbers |
| Divides a two-digit number by a one-digit number |  |
| Supplies one factor of a two-digit number (1 of 2 points) |  |

[^23]| N04_02 | Divides a two-digit number by a one-digit number with a remainder |
| :---: | :---: |
| N07_02 | Multiplies a one-digit number by a two-digit number |
| N04_04 | Implements a one-step rule to generate the next number in a pattern |
| N07_07 | Finds the missing term in an addition number sentence |
| N12_05 | Identifies the missing term in an addition sentence |
| N12_06 | Implements a one-step rule forward and in reverse to partially complete a table (1 of 2 points) |
| N14_04 | Solves for the missing number in a multiplication sentence |
| N14_05 | Identifies the operation for an expression that represents a situation |
| N01_07 | Writes a fraction larger than a given unit fraction |
| N03_06 | Recognizes a unit fraction represented pictorially |
| N04_07 | Solves a word problem involving addition of one-place decimals |
| N09_08 | Recognizes a non-unit fraction represented pictorially |
| Measurement and Geometry |  |
| N03_09 | Solves a word problem involving addition of three one-digit numbers |
| M03_10 | Relates a specified face of a cube to its net |
| N01_08 | Identifies a cylinder |
| N03_08 | Writes the names of four common two-dimensional shapes |
| N05_10 | Completes a rectangle on a square grid |
| N11_11A | Identifies the tallest of four rectangular prisms represented pictorially |

Items beginning with " N " are items unique to less difficult mathematics.

| N12_10 | Completes a symmetric figure on a square grid given half the shape and the line of <br> symmetry |
| :--- | :--- |
| N14_09 | Determines the number of lateral faces of a given rectangular prism |
| N09_10 | Identifies a cube |
| N11_11B | Identifies the greatest volume of four rectangular prisms represented pictorially |
| Data |  |
| M10_11 | Represents data from a table in a bar graph |
| N01_04A | Reads data from a bar graph |
| N04_13 | Represents data from a table in a bar graph (1 of 2 points) |
| N04_14 | Evaluates statements about data in a pictograph (1 of 2 points) |
| N05_05A | Reads data from a table |
| N05_05B | Compares data presented in a table |
| N07_05 | Uses data from a table to complete a bar graph (2 of 2 points) |
| N07_05 | Uses data from a table to partially complete a bar graph (1 of 2 points) |
| N13_04A | Reads data from a bar graph |
| N13_04B | Reads data from a table |

## Items at Intermediate International Benchmark (475)

| Number |  |
| :--- | :--- |
| M02_01 | Identifies a three-digit number given the place values of two of its digits |
| M05_01 | Adds a four-digit and a three-digit number |
| M06_02 | Divides a three-digit number by a one-digit number |
| M11_03_02 | Determines a four-digit number given the place values of the digits |
| M12_01 | Identifies a four-digit number given in words in expanded form |
| N01_01 | Subtracts a two-digit number from a three-digit number |
| N01_03 | Determines a four-digit number given the values of two of its digits |
| N03_03B | Justifies the greatest number if one of four numbers is increased by 100 |
| N05_02 | Solves a two-step word problem involving subtraction of one- and two-digit numbers |
| N05_03 | Solves a word problem involving division of a two-digit number by a one-digit number |
| N07_06 | Finds the missing term in an addition word problem |
| N09_04 | Determines the smallest 3-digit number with three given digits <br> N12_04Solves a multi-step word problem involving multiplication of one-digit numbers and <br> comparison of two-digit numbers |
| M03_03 | Compares representations of a value in numbers and in words and explains answer <br> digit numbers and explains answer |
| Identifies a four-digit number given in expanded form |  |

Items beginning with "N" are items unique to less difficult mathematics.

| M04_01 | Subtracts a three-digit number from a four-digit number |
| :--- | :--- |
| N11_06 | Solves a multi-step word problem involving multiplication of one-digit numbers and <br> addition of two-digit numbers |
| M09_01 | Adds a four-digit, three-digit, and two-digit number |
| N03_05 | Solves a word problem involving subtraction of one- and two-digit numbers |
| N04_01 | Solves a word problem involving subtraction of two three-digit numbers |
| N07_01 | Solves a word problem involving multiplication of one- and two-digit numbers |
| N09_03 | Subtracts a two-digit number from a three-digit number |
| N11_01 | Identifies a four-digit number given the digits in two places |
| N11_03 | Divides a two-digit number by a one-digit number with a remainder |
| M04_03 | Identifies the missing number in two number sentences with inequalities |
| M13_05 | Solves for the missing number in a subtraction sentence |
| N04_06 | Identifies an expression with addition and subtraction that represents a situation |
| N09_06 | Determines the missing number in a well defined number pattern |
| N12_06 | Implements a one-step rule forward and in reverse to complete a table (2 of 2 points) |
| N05_04 | Identifies an arithmetic operation that represents a situation |
| Determines the operation to complete a number sentence |  |
| Identifies an expression that represents a situation |  |
| Supplies a fraction larger than one half |  |

Items beginning with " N " are items unique to less difficult mathematics.

| N05_08 | Orders two decimals and a whole number |
| :--- | :--- |
| N13_07 | Solves a word problem involving addition of decimals |
| M01_02 | Identifies the representation of a non-unit fraction |
| Measurement and Geometry |  |
| N04_06 | Measures the vertical height of an object with a ruler |
| N05_11 | Solves a multi-step word problem involving multiplication and addition of mass |
| N05_12 | Solves a word problem involving addition of hours and minutes |
| N13_10 | Determines the perimeter of a triangle given the side lengths |
| N13_11 | Solves a word problem involving addition of hours and minutes |
| N14_08 | Identifies the appropriate metric unit of volume for an object |
| N03_10 | Solves a word problem involving subtraction of hours and minutes |
| N09_09 | Identifies the appropriate metric unit of measurement for an object |
| M01_07 | Identifies the number of triangular faces in a given three-dimensional shape |
| M02_09 | Completes a symmetric figure on a square grid given half the shape and the line of <br> symmetry |
| N01_06 | Identifies a square |
| Identifies a street perpendicular to a given street |  |
| Identifies a shape with equal angles |  |
| Identifies a common shape inside another common shape |  |

Items beginning with " $N$ " are items unique to less difficult mathematics.

## Data

M01_09A Identifies the greatest value in a bar graph
M02_10A Reads data from a line graph

M10_12A Represents data in a table

M12_10 Identifies a title and axis labels for a bar graph

M13_10A Reads data from a graph

N04_12 Reads data from a tally chart

N04_13 Represents data from a table in a bar graph (2 of 2 points)
N14_12 Labels a bar on a bar graph given data in a tally chart

M14_10 Solves a word problem involving reading data from a table

N12_11 Reads data from a table

N12_12A Identifies the label for a bar in a bar graph given the data in a table

N14_11 Reads data from a table
M04-12 Determines one or two out of three missing values in a table given conditions for the data (1 of 2 points)

N09_05 Uses data from a bar graph to solve a problem

## Items at High International Benchmark (550)

| Number |  |
| :--- | :--- |
| M01_01 | Identifies the set of numbers having a given number as a factor |
| M02_02 | Solves a word problem involving division of a two-digit number by a one-digit number |
| M03_02 | Multiplies a two-digit number by a two-digit number |
| M05_02 | Identifies the number closest in size to a given four-digit number |
| M05_03 | Solves a word problem involving division |
| M06_01 | Classifies two- and three-digit numbers as even or odd |
| M06_03 | Devises one way of grouping objects that satisfy two conditions (1 of 2 points) |
| M07_01 | Solves a multi-step word problem involving multiplication and addition of whole <br> numbers |
| M07_03 | Solves a word problem involving multiplication of two-digit numbers |
| M08_01 | Solves a word problem involving division of a two-digit number by a one-digit number <br> with a remainder |
| M08_02 | Solves a word problem involving subtraction of a two-digit number from a four-digit <br> number |
| M09_03 | Devises one way to allocate money in a given context (1 of 2 points) |
| M10_02 | Solves a word problem involving multiplication of a three-digit number by a one-digit <br> number |
| M11_01 | Rounds a four-digit number to the thousands place |
| Solves a problem set in a novel situation involving addition and comparison of whole <br> numbers and justifies the solution |  |
| position (1 of 2 points) |  |

| M13_03 | Identifies a true statement about comparison of two- and three-digit numbers |
| :--- | :--- |
| M03_09 | Finds the distance between two positions on a number line |
| M11_02 | Identifies a number that satisfies two conditions of multiples |
| M09_08 | Finds the halfway point between two positions on a number line |
| M14_02 | Solves a word problem involving subtraction of two three-digit numbers |
| M01_05 | Follows a two-step rule to extend a number pattern |
| M03_06 | Solves for a repeated missing number in a subtraction sentence |
| M06_06 | Determines the operation to complete a number sentence with operations on both <br> sides |
| M07_05 | Solves a number sentence involving division an expression that represents a situation |
| M08_03 | Determines the place of three numbers in a number sentence with operations on both <br> sides |
| M09_06 | Identifies an expression that represents a situation |
| M12_04A | Implements a two-step arithmetic rule to a given number |
| M13_02 | Determines whether three pairs of numbers follow a given two-step rule <br> M13_07 |
| Follows a two-step rule to generate the next number in a pattern |  |
| M02_04 | Identifies an expression with multiplication and subtraction that represents a situation |

| M01_04A | Solves a word problem involving rectangular representations of fractions |
| :--- | :--- |
| M01_04B | Solves a word problem involving rectangular representations of fractions |
| M06_04 | Solves a word problem involving subtraction of a non-unit fraction from 1 |
| M07_06 | Adds a whole number and a two-place decimal |
| M09_05 | Solves a word problem involving subtracting one-place decimals |
| M14_05 | Solves a word problem involving addition of three two-place decimals |
| M02_06 | Identifies the appropriate metric unit of measurement for three objects |
| M04_06A | Solves a word problem involving multiplication of lengths |
| M05_04 | Solves a word problem involving addition of time |
| M05_11 | Solves a problem by filling a three-dimensional shape with rectangular solids |
| M14_07 | Solves a word problem involving conversion of minutes to hours |
| M10_06 | Estimates the total length of an object given the length of part of it |
| M12_06 | Estimates the length of an object given the length of another object |
| M11_08 | Classifies angle types in a figure |
| M12_05 | Identifies a pair of shapes that make a rectangle |
| M14_09 | Identifies a two-dimensional view of an irregular three-dimensional figure |

| M07_09 | Identifies the two-dimensional view of a three-dimensional object |
| :---: | :---: |
| M09_09 | Identifies a solid given two faces |
| Data |  |
| M02_11 | Represents data from a table in a pictograph |
| M04_10B | Compares data in a table |
| M05_12 | Completes a bar graph using information from a pictograph |
| M07_12 | Identifies a pie chart that has the same information as a bar graph |
| M08_11 | Determines whether questions can be answered with data in a table |
| M08_13 | Determines the key for a pictograph and uses it to complete the graph (1 of 2 points) |
| M10_10A | Reads data from a line graph |
| M11_11A | Uses a key to retrieve data from a pictograph |
| M12_09A | Uses a key to retrieve data from a pictograph |
| M12_11 | Labels sections of a pie chart given three conditions for the data |
| M14_11A | Evaluates statements about data in a bar graph |
| M14_13 | Completes a table for a given data series |
| M06_11 | Identifies a pie chart that represents given data |
| M07_11 | Uses information from a bar graph to solve a problem |
| M10_10B | Extrapolates a point on a line graph with constant slope |
| M10_12B | Interprets data in a table to solve a problem |
| M13_10B | Extrapolates from a graph to solve a problem |

## Number

| M01_03 | Solves a multi-step problem involving division and gives a reason for their answer |
| :---: | :--- |
| M03_03 | Solves a multi-step word problem involving addition and subtraction of two- and three- <br> digit numbers |
| M04_02 | Determines a number that meets two conditions of multiples and one condition of order |
| M06_03 | Devises two ways of grouping objects that satisfy two conditions (2 of 2 points) |
| M09_03 | Devises two ways to allocate money in a given context (2 of 2 points) |
| M10_03 | Solves a multi-step word problem involving division of one- and two-digit numbers with <br> remainders |
| M11_09 | Given two positions on a curved path, follows specified moves and labels another <br> position (2 of 2 points) |
| M13_01 | Recognizes equivalent three-digit numbers written in expanded form |
| Divides a three-digit number by a one-digit number |  |

M09_07 Identifies the missing number in a number sentence with operations on both sides

M12_04B Implements a two-step rule in reverse to generate the previous number in a pattern

M13_06 Identifies an operation that represents a situation

M04_04 Identifies an expression with division and addition that represents a situation

M10_04 Solves a word problem by extending a pattern

M11_07 Identifies number sentence that represents a situation

M02_03 Identifies non-unit fractions greater than a given unit fraction

M03_04 Solves a problem to identify a fraction that represents the shaded portion of a figure

| M03_05 | Solves a word problem involving division with a remainder (1 of 2 points) |
| :---: | :---: |
| M05_05 | Identifies a fraction equivalent to a given fraction |
| M05_06 | Solves a multi-step problem involving fractions |
| M06_05 | Draws a complete shape on a grid given a picture of a fraction of the shape |
| M07_02 | Identifies a fraction equivalent to a one place decimal |
| M08_05 | Identifies a decimal given the place values of two of its digits |
| M10_05 | Identifies the larger number among pairs of one- and two-place decimals |
| M11_05 | Solves a word problem involving adding fractions with different denominators |
| M13_04 | Identifies a number between a one-place decimal and two-place decimal |
| M07_04 | Identifies a set of objects with a given fraction shaded |
| Measurement and Geometry |  |
| M02_08 | Determines the number of three different shapes that cover the area of a square (2 of 2 points) |
| M02_08 | Determines the number of two different shapes that cover the area of a square (1 of 2 points) |
| M04_06B | Solves a word problem involving division of lengths |
| M05_10 | Reads a ruler to find the length of one side of an equilateral triangle and finds its perimeter |
| M06_08 | Reads a ruler to find the length of a line segment beginning and ending at half-units |
| M07_07 | Reads a ruler to find the length of an object beginning at a half-unit |
| M08_07 | Solves a word problem involving subtraction of volumes |
| M08_10 | Determines two sides lengths of a hexagon given the other four side lengths and its perimeter |

| M10_07 | Draws a rectangle with a given perimeter on a square grid |
| :---: | :---: |
| M10_09 | Solves a multi-step word problem involving multiplication and division of lengths, with a remainder ( 1 of 2 points) |
| M12_07 | Determines the number of unit cubes to fill a rectangular prism and explains method (2 of 2 points) |
| M12_07 | Determines the number of unit cubes to fill a rectangular prism and explains method (1 of 2 points) |
| M12_08 | Measures a horizontal object with a ruler and applies a scale to determine its length |
| M14_06 | Identifies the speed shown on a speedometer |
| M02_07 | Solves a multi-step word problem involving multiplication and division of weights |
| M04_05 | Estimates the height of an object given the height of another object |
| M04_07 | Determines the weight of an object given a series of three balanced scales |
| M07_10 | Finds the area of a rectangle given its dimensions |
| M08_08 | Analyzes information in a time table to solve a word problem |
| M14_08 | Identifies the area of a rectangle drawn at an angle on a square grid |
| M03_08 | Identifies parallel lines on a geometric shape |
| M04_08 | Draws a line on a square grid that is parallel to a given line and passes through a specified point |
| M04_09 | Identifies properties of two pentagons |
| M06_09 | Recognizes acute angles in an irregular quadrilateral |
| M06_10 | Determines the number of square and triangular faces of three-dimensional shapes (2 of 2 points) |
| M06_10 | Determines the number of square and triangular faces of three-dimensional shapes (1 of 2 points) |
| M07_08 | Given a line, draws another line to form an angle less than a right angle |

| M09_10A | Draws a parallel line on a square grid given conditions |
| :--- | :--- |
| M13_08 | Draws an obtuse angle on a square grid given one side |
| M01_06A | Identifies a street parallel to a given street |
| M05_09 | Identifies a shape that has both line and rotational symmetry |
| M11_10 | Identifies a net of a hexagonal prism |
| M02_12 | Determines the y-axis scale for a bar graph given the data in a table |
| M03_11 | Represents data from a table in a pie chart |
| M14_12 | Determines the key for a pictograph and uses it to complete the graph (2 of 2 points) |
| M01_09B | Interprets a bar graph to solve a two-step problem |
| M04_12 | Determines three missing values in a table given conditions for the data (2 of 2 points) |
| M11_11B | Uses information in a pictograph to solve a problem |
| M12_09B | Uses data from a pictograph to solve a problem |
| M12_12 | Compares the slope of two lines on a graph for a specific period and explains answer |

## Items Above Advanced International Benchmark (625)

## Number

| M02_05 | Solves a multi-step word problem involving unit price (2 of 2 points) |
| :--- | :--- |
| M02_05 | Solves a multi-step word problem involving unit price (1 of 2 points) |
| M09_04 | Determines the missing digit for a two-digit number that satisfies two conditions |
| M08_04 | Solves a word problem by implementing a one-step rule to generate numbers in a <br> pattern |
| M03_05 | Solves a word problem involving division with a remainder and justifies the solution (2 <br> of 2 points) |
| M12_03 | Adds a one-place decimal and a two-place decimal |

Measurement and Geometry

| M10_09 | Solves a multi-step word problem involving multiplication and division of lengths, with a <br> remainder (2 of 2 points) |
| :---: | :--- |
| M01_08 | Identifies a net of a given object |
| M05_07 | Identifies a rule to sort shapes into two sets |
| M09_10B | Draws a perpendicular line on a square grid given conditions |
| M10_08 | Identifies properties of a parallelogram and a rectangle |
| Data | Analyzes data in two bar graphs to refute a conclusion |
| M04_11 | Represents data from a table in a line graph (2 of 2 points) |
| M08_14 | Represents data from a table in a line graph (1 of 2 points) |
| M08_14 |  |

## Appendix 15B: Grade 4 Science Item Descriptions Developed During the TIMSS 2019 Benchmarking

|  | Items at Low International Benchmark (400) |
| :--- | :--- |
| Life Science |  |
| S06_01 | Recognizes an animal that has a backbone |
| S10_01 | Identifies 4 or 5 of 6 animals as birds, insects, mammals, or reptiles (1 of 2 points) |

## Physical Science

| S04_10 | Identifies the most likely material making up a spoon that gets hot sitting in a pot of boiling <br> soup |
| :---: | :--- |
| Earth Science |  |
| S04_12 | Identifies natural resources used to grow plants |

Items at Intermediate International Benchmark (475)

## Life Science

S14_05 Explains why a plant kept by a window is healthier than a plant kept in a closed closet

S12_05 Identifies the characteristic used to sort animals into two groups

S04_01 Recognizes the function in common between a hedgehog's spines and snail's shell
S13_03 Analyzes a diagram to explain which flower will grow better
S01_01 Recognizes that in mammals, a male and female of the same kind are needed to reproduce

S11_06 Describes one way a polar bear's fur helps it survive (1 of 2 points)

S03_05 Describes how human heart rate changes during exercise

| S06_04 | States two reasons why a plant will not survive by analyzing given conditions |
| :---: | :---: |
| S05_04 | States one reason why plastic objects in the ocean are dangerous for sea animals |
| S03_03 | Recognizes a living thing that produces its own food (1 of 2 points) |
| S04_03 | Identifies a predator and its prey |
| S09_02 | States two things that plants need from their environment to make their own food |
| S13_04 | Evaluates two diagrams to explain which environment is better for sharks |
| S10_02 | Explains why a person should wash their hands before eating even if they do not appear dirty |
| S09_01 | Recognizes why milk is important in a balanced diet |
| Physical Science |  |
| S06_06 | Recognizes the states of matter of three different materials |
| S09_08 | Classifies materials as solids, liquids, or gases |
| S10_10 | Recognizes an object that could be used to complete a circuit to light a bulb |
| S13_08 | Identifies the best material to complete a circuit |
| S07_09 | Using a model of a flashlight, identifies an object that can be used to complete an electrical connection |
| S08_08 | Predicts what will happen to magnets in plastic and iron cups when the cups are turned upside down |
| S14_08 | Identifies which of six objects can be picked up using a magnet |
| S10_07 | Explains why a flashlight needs batteries in order to turn on |
| S12_07 | Describes what will happen to the temperature of a table where it touches the bottom of a hot cup of tea |
| S04_07 | Identifies the diagram that shows a circuit where a bulb will be lit |

S11_10 Identifies why a bulb will not light in a model of an electric circuit
S07_08 Gives a reason why two objects of the same shape and size travel different distances after a push

S09_09 Explains why one object requires more force to start its motion than another
S02_10 Recognizes the best explanation for why a box on a cart is easier to pull than a box resting directly on the floor

S08_07 Recognizes the ramp that will make it easiest to move a heavy box onto a table

## Earth Science

S05_10 Matches each item in a list of Earth's landscape features to its description
S14_11 Recognizes the cause of the movement of sand dunes in a desert

Items at High International Benchmark (550)

## Life Science

S02_01 Lists two living things and two nonliving things shown in a picture of a desert ecosystem
S02_03 Identifies characteristics that describe either a toy duck and a living duck or only a living
S06_02 Describes two ways that a mammal helps its young survive

S03_04 Recognizes a feature of how snakes eat

S01_05 Identifies a function of a plant's stalk by interpreting an observation from an investigation

S02_02 Identifies the human organ with the same function as a fish's gills
S11_03 Completes a diagram describing the stages in the life cycle of a flowering plant
S12_01 Orders the life stages of a butterfly within a diagram

| S08_04 | Identifies the process that must have occurred in a strawberry plant from two pictures of the plant taken four weeks apart |
| :---: | :---: |
| S14_02 | Recognizes another life stage of a caterpillar |
| S04_05 | Identifies the characteristics that a female rabbit's mate must have |
| S10_05 | Recognizes a characteristic of a seedling that will show whether it is a fir tree or a cherry tree |
| S08_02 | Identifies the picture showing the seedling form of an adult plant |
| S02_06 | Describes how holding its tail over its head helps a ground squirrel survive in hot, dry environments |
| S05_03 | Recognizes an advantage of thin, pointed leaves compared to broad, flat leaves |
| S11_04A | Interprets data from an investigation to recognize the best condition for growing plants |
| S09_03 | Identifies a reason that some mammals pant on hot days |
| S11_05 | Relates factory pollution to its effect on farm fields |
| S14_01 | Identifies which of six animals could live in a desert |
| S02_04 | Explains how an increase in the number of bats in an area could lead to a decrease in the number of insects |
| S03_02 | Uses a list of living things in an Arctic ecosystem to complete a food chain |
| S08_03 | Completes a food chain using three given animals |
| S06_03A | Uses a food web to identify what a predator eats |
| S05_05 | Provides a possible reason why some trees in a group do not grow as well as others |
| S01_02 | Explains that germs can be transmitted even when people do not appear to be sick |
| S04_06 | Describes how germs can still spread if a person covers their mouth with their hands when they cough |
| S12_02 | Explains how one way of eating ice cream exposes a person to fewer germs than another way of eating ice cream |

S09_06 Recognizes a way to avoid spreading the flu

## Physical Science

S05_07 Describes a difference between ice and water in addition to their physical states

S11_07 Identifies a physical property of metal pot that makes it good for boiling water

S01_09 Using a diagram, identifies which hidden object could complete an electric circuit

S01_07 Observes that two metal bars repel and determines whether they are magnets
S12_10 Identifies an explanation for why magnets push against each other when they are brought together

S03_06 Identifies a way to sort objects containing metals

S10_08 Recognizes a pair of carts carrying magnets that will move away from each other
S03_08 Recognizes what happens to the water when a puddle of water on a metal tray becomes smaller

S11_09A Explains why boiling decreases the amount of water in a container

S11_09B Predicts the effect on a cold window glass of boiling water nearby

S07_06 States a reason for the color change and surface roughening of a metal object over time
S03_10 Explains why pressing a guitar string stops the sound

S05_09A Identifies from a diagram how a shadow is formed

S03_07 Analyzes a diagram to identify one way to make a shadow bigger
S04_09 Identifies a graph showing the relationship between increasing the force used to hit a drum and the loudness of the drum's sound

S01_08 Explains that heat in a metal object reaches the nearest point soonest
S12_08 Recognizes the energy change occurring in a circuit with a battery and a lightbulb

S14_09 Explains which of two circuits will have a lit bulb

S02_09 Recognizes the energy change that occurs when a flashlight is turned on
S14_07 Recognizes the energy change that occurs in an electric iron

S08_10 States the force that causes a skydiver and a book to fall
S14_10 Recognizes the force that makes it more difficult to move a sofa on a rug than on a wood

S02_08 Recognizes the force that causes a skydiver to fall to Earth
S12_06 Identifies the force that makes an open parachute fall more slowly than a crumpled parachute

S08_09 Identifies a description of how a pulley makes it easier to move a heavy box

## Earth Science

S08_11 Recognizes what covers most of Earth's surface

S14_12 Recognizes the best way to replenish a forest from which wood is taken

S12_12 Explains what a fish fossil reveals about the history of a desert area
S08_12 Interprets data in a table to identify which of two locations is a desert and explains reasoning
S06_10A Interprets information from a graph to recognize which crops will grow best in an area with given precipitation

S03_12 Recognizes which step in a diagram of a water cycle shows evaporation

S11_01 Recognizes which place is likely to have weather that is hot and wet

S01_11 Recognizes that the solar system is made up of the Sun and its planets
S03_11 Using two pictures of the same location, explains that the Moon can look different at different times

S10_13 Recognizes pictures of shapes the Moon can have

S12_13 Identifies a diagram that represents the Solar System

S07_11 Recognizes a feature of the Moon from observations over a month
S11_02 Recognizes seasons north and south of the Equator

S04_11 Interprets a diagram of the Sun and the Earth to identify the season in a labeled city

## Items at Advanced International Benchmark (625)

## Life Science

S01_04 States two things in addition to water that animals need to survive

S05_01 States one difference between living things and nonliving things

S10_01 Identifies 6 of 6 animals as birds, insects, mammals, or reptiles (2 of 2 points)

S07_01 Recognizes the function of muscles attached to bones
S07_05 Draws a conclusion by relating one function of feathers to keeping a body warm in the case of dinosaurs

S03_01 Recognizes the plant part that produces seeds
S09_04 Identifies a difference in the life cycles of a grasshopper and a butterfly
S04 04 States either an advantage for a dandelion to make many seeds or an advantage for a dandelion to make light, fluffy seeds (1 of 2 points)

S07_03Z Recognizes whether labeled features of a bird are inherited

S12_03 Identifies an explanation for why laying many eggs is helpful for insects' survival
S01_03B Identifies a desert plant and describes one feature that helps it survive in the desert
S10_04 States why it is better for a lemur to sit in the sun with its arms outstretched rather than at its sides in order to get warm

S11_06 Describes two ways a polar bear's fur helps it survive (2 of 2 points)
S07_04 Evaluates three experimental designs and explains which is best to test if plants need light to grow

S08_06 States one way that the human body reacts to cold temperatures

S11_04B Identifies a conclusion about plant growth using data from an investigation

S10_06 Recognizes the ecosystem where a set of living things is most likely to be found

S02_05 Recognizes how a Venus flytrap differs from most other plants

S09_05 Predicts the consequences of removing a predator from an animal's habitat
S12_04 Explains why the number of mice in a town increased after trees were cut down
S10_03 Identifies the food chain that best shows how energy is transferred from the Sun to an owl

S06_03B Uses a food web to determine which animals are competitors

S13_02 States two ways to avoid catching illness in a crowded space

S13_05 Describes how boiling water makes it safe to drink
Physical Science

| S13_06 | Recognizes one property of a liquid |
| :--- | :--- |
| S01_06 | Identifies that two objects of the same size and shape have the same volume and, from a <br> diagram, that they have different masses |
| S06_08 | Explains how to separate a mixture of two types of solids of different sizes |
| S09_07 | Predicts which of two objects is a better conductor of heat with supporting explanation |
| S11_08A | Evaluates the best way to separate a mixture of solids of similar size |
| S05_08 | Identifies that the temperature at which an object melts depends on the material from <br> which it is made |

S11_08B Evaluates the best way to separate a mixture of things that dissolve and things that do not dissolve

S04_08
Predicts how a train car with a magnet attached will move when another train car with a magnet attached is brought towards it

S02_07 Recognizes a change in which the materials in objects stay the same
S06_09A Recognizes set-ups that will more quickly dissolve a solid in water

S06_09B Explains the importance of controlling a variable in an experiment
S13_07 Evaluates the best set-up to investigate whether temperature affects the rate at which a solid dissolves in water

S14_06 Identifies a statement describing the change that occurs when water boils
S10_09 Identifies conclusions that are supported by the results of an experiment during which a gas is collected in a balloon

S05_09B Recognizes that a shadow produced in colored light is black

S09_10 States one form of energy present in a model of an electric circuit (1 of 2 points)
S13_09 Recognizes a diagram that demonstrates motion due to gravity

## Earth Science

S01_10 Identifies the diagram that shows relative amounts of water and land on the Earth's surface
S02_11A States one advantage of farming near a river

S02_11B States one disadvantage of farming near a river

S05_11 Identifies how fish fossils are formed

S09_12 From pictures of rock formations, identifies how a given rock may have looked long ago
S10_12 Identifies the best explanation for finding a tropical plant fossil in a cold region
S13_10 Relates two different environments and weathering effects on rocks

| S13_12 | Interprets information from temperature graphs to identify which of two places has certain climate properties |
| :---: | :---: |
| S06_10B | Synthesizes precipitation information from a graph and diagram to recognize the best area to plant a crop in a given climate |
| S07_10 | Identifies that clouds are made of water droplets |
| S09_11 | Recognizes a diagram showing the correct relative positions of the Earth, Moon, and Sun |
| S02_12 | Places the Earth in a model to show its position relative to the Sun when a labeled city is experiencing summer |
| S07_12 | Interprets a diagram of the Earth and the Sun to describe how Earth turning on its axis causes day and night in a particular location |
| S08_13 | Identifies a picture of a tree and its shadow in the afternoon based on a picture of the tree and its shadow in the morning |
| S12_11 | Interprets a diagram of a man and his shadow to identify the Sun's relative position when his shadow will be shorter |
|  | Items Above Advanced International Benchmark (625) |
| Life Science |  |
| S04_02 | Identifies which of four animals have backbones |
| S07_02 | Recognizes the main function of leaves on a plant |
| S04_04 | States both an advantage for a dandelion to make many seeds and an advantage for a dandelion to make light, fluffy seeds (2 of 2 points) |
| S14_04 | Explains why a single elephant calf has a better chance of survival than a single frog egg |
| S01_03A | Explains that to test the survival of plants, they should be compared under different conditions |
| S05_06 | Identifies that more use of public transportation will decrease air pollution in a large city |
| S03_03 | Recognizes a living thing that produces its own food and describes the process (2 of 2 points) |
| S08_05 | Identifies the animal that competes with giraffes for food |

## Physical Science

S07_07 Explains why a metal spoon in hot soup feels hotter than a wooden spoon in hot soup
S06_07 Explains the process by which wet objects become dry

S03_09 States one source of energy other than sunlight that can be changed into electricity

S09_10 States two forms of energy present in a model of an electric circuit (2 of 2 points)

Earth Science

S13_11 Recognizes four true statements about recycling metals
S14_13 Explains one benefit of using sunlight or wind to produce electricity compared to oil or natural gas

S10_11 Interprets data in a table to identify the place where is it most likely to rain

## Appendix 15C: Grade 8 Mathematics Item Descriptions Developed During the TIMSS 2019 Benchmarking

| Items at Low International Benchmark (400) |  |
| :--- | :--- |
| Number |  |
| M09_01 | Recognizes a 7-digit number given in words |

## Items at Intermediate International Benchmark (475)

## Number

M01_02A Solves a word problem involving addition of time

M06_01 Solves a word problem involving subtraction of negative numbers

M07_03 Solves a two-step word problem involving whole numbers
M05_02 Solves a word problem involving subtraction of negative numbers
M04 03 Determines whether a series of decimals are greater than, less than, or equal to fractions (1 of 2 points)

M06_02 Identifies equivalent ratios

M10_05 Given a ratio, represents an equivalent ratio pictorially

Algebra

M04_07A Solves a word problem involving an inequality and explains answer
M08_08A Extends a given geometric pattern to supply the value of the 7th term

Geometry
M02_10 Determines the value of an angle in an irregular quadrilateral given the values of the other angles

M14_10 Identifies the reflections of irregular shapes

M11_11 Determines the total number of stacked unit cubes

## Data and Probability

M05_12 Finds and compares the unit prices of four objects

M05_14 Identifies the bar graph that matches the information shown in a table

M07_12A Compares data from two line graphs to solve a problem

M07_12B Reads data from a line graph

M09_12A Calculates mean and median for one ordered lists of data (1 of 2 points)

M13_11 Evaluates information given by a time/distance graph

M01_12 Solves a problem given the chance of an outcome

M03_14A Estimates an expected value given an observed sample

## Items at High International Benchmark (550)

## Number

M03_01 Identifies an expression equivalent to a given division expression

M05_01 Evaluates an expression involving negative whole numbers and parentheses

M05_05A Solves a word problem involving multiplication and addition of whole numbers

M10_01 Adds two numbers with different exponents and bases

M11_02 Solves a word problem involving division of whole numbers with a remainder

| M14_01 | Identifies the number with the most factors |
| :---: | :---: |
| M01_03 | Understands a property of adding multiples |
| M01_04 | Writes a decimal with three places as a fraction |
| M03_03 | Finds the missing value in an addition problem with both fractions and decimals |
| M04_03 | Determines whether a series of decimals are greater than, less than, or equal to fractions (2 of 2 points) |
| M05_04 | Given the two parts of a whole in a word problem, identifies the fraction which represents one part |
| M07_04 | Determines what fraction of a 10X10 grid is shaded |
| M13_02 | Solves a two-step word problem involving subtraction of whole numbers and multiplication of a fraction |
| M14_02 | Determines the numerator that makes two fractions equivalent |
| M01_01 | Identifies the representation of a fraction equivalent to a given representation of a fraction |
| M08_02 | Adds two decimals represented in words |
| M11_01 | Solves a word problem involving a fraction of a whole |
| M12_03 | Identifies a decimal equivalent to the sum of two fractions with denominators that are powers of ten |
| M04_04 | Solves a word problem involving a fraction of a whole |
| M02_04 | Solves a word problem involving a three-part ratio |
| M03_04 | Shades a percent of a figure |
| M10_04 | Solves a word problem involving ratios |
| M13_04 | Solves a word problem involving ratios and decimals |
| M14_04A | Determines a ratio to model a situation |

M14_04B Determines a ratio to model a situation
M07_01 In a word problem for dividing a given quantity in a given ratio, determines the quantity of one of the parts.

## Algebra

M01_06 Identifies the equivalent algebraic expression involving exponents and multiplication
M02_07 Solves a word problem involving evaluating a formula with exponents

M10_06 Evaluates an expression with two variables

M10_09 Solves a pair of simultaneous linear equations in two variables
M12_06 Evaluates a formula with an exponent
M12_08 Solves a word problem involving simultaneous linear equations in two variables
M14_05 Identifies an expression that represents a situation

M14_06 Solves a linear equation involving fractions

M14_07 Solves a word problem involving evaluating a formula with two variables

M05_07 Evaluates an algebraic expression involving fractions and integers

M08_05 Evaluates an expression with a square root and two variables with exponents

M08_07 Solves a multi-step word problem involving linear inequalities

M11_06 Identifies an equation that models a situation

M02_05 Evaluates an expression with two variables

M03_07 Identifies an algebraic expression that represents the perimeter of an irregular shape
M04_06 Evaluates an equation with three variables

| M07_06 | Evaluates the power of an expression given its value |
| :---: | :---: |
| M11_07 | Identifies an expression for the area of part of a geometric figure |
| M13_05 | Solves a linear equation in two-variables given the value of one variable |
| M01_07A | Extends a given geometric pattern to find the value of the 10th term |
| M03_08 | Determines a missing coordinate for a linear relationship given in a table |
| M04_08A | Extends a given geometric pattern to supply the value of the 10th term |
| M11_08 | Uses values for a linear function to determine an extrapolated value |
| M13_07 | Identifies the true statement about a linear relationship given in a graph |
| Geometry |  |
| M02_11 | Compares properties of two open cylinders made by rolling the same rectangle in different directions |
| M02_12 | Determines the coordinates of a trapezoid's missing vertex given a congruent trapezoid in the Cartesian plane |
| M03_10 | Finds the coordinates of a midpoint given two points in the Cartesian plane |
| M03_12 | Draws rectangle on square grid given area and perimeter (1 of 2 points) |
| M05_10 | Identifies the value of an angle involving properties of corresponding and supplementary angles |
| M07_10 | Solves a problem involving similar triangles |
| M08_09A | Determines the area of a parallelogram given its base and height |
| M08_09B | Uses the Pythagorean theorem to solve for a side length of a parallelogram and calculates the perimeter (1 of 2 points) |
| M08_10 | Completes a parallelogram in the Cartesian plane given three of its vertices |
| M09_09 | Recognizes congruent quadrilaterals |

| M13_08A | Solves a word problem involving the length around a hexagonal prism |
| :--- | :--- |
| M13_09 | Determines the number of exposed faces for unit-cubes that make up a larger cube (1 <br> of 2 points) |
| M01_11 | Solves a problem involving angles of a triangle |
| M10_13 | Identifies the net of a triangular prism |
| M11_09 | Identifies the reflection of a partly shaded shape |
| Data and Probability | Solves a two-step word problem involving volume of a rectangular prism and cost |
| M02_13 | Computes the mean of five positive and negative values |
| M02_14 | Identifies an appropriate graph for three different types of data |
| M08_11A | Computes the mean of four given values |
| M10_14 | Identifies relevant considerations for systematic data collection |
| M12_14A | Computes the mean of five six-digit numbers |
| M14_14 | Estimates the value of a bar in a bar graph without a scale given the value of another <br> bar |
| M01_13B | Uses and interprets data sets in pie charts to solve a problem involving percentages |
| M08_12 | Estimates the probability of an event given an observed sample |
| M06_12 | Estimates a spinner that has given probabilities |

## Items at Advanced International Benchmark (625)

## Number

## M02_01 Recognizes true or false statements based on properties of operations

M03_02 Solves a two-step word problem involving whole numbers

M04_01 Identifies numbers that are perfect squares

M04_02 Analyzes truth of statements about the properties of a whole number

M05_05B Solves a non-routine word problem involving whole numbers

M06_04 Uses four different digits to write two two-digit numbers with the smallest product

M08_01 Justifies that a given number satisfies a condition for its parity and factors

M12_01 Determines two integers that satisfy two conditions involving their sum and product

M07_02 Identifies a prime number

M13_01 Identifies an expression equivalent to a given multiplicative expression

M02_03 Solves a multi-step problem involving addition and subtraction of fractions

M08_03 Determines the missing value in a multiplication sentence involving fractions

M10_02 Determines the location of the product of two fractions on a number line

M12_02 Orders fractions and decimals
M12_04 Determines the denominator that makes the sum of a fraction and a whole number equivalent to a decimal

M14_03 Uses four different digits to write two fractions with the largest product

| M02_02 | Identifies the location of a fraction on a number line |
| :---: | :---: |
| M01_02B | Solves a word problem involving percentages and elapsed time |
| M05_03 | Solves a two-step word problem involving percentages |
| M06_03 | Determines the dimensions of a rectangle that is similar to a given rectangle |
| M08_04 | Recognizes fractions and decimals equivalent to a given percentage |
| M09_02 | Given the volume of a fraction of a container, determines the total volume for multiple containers of the same size |
| M09_03 | Solves a word problem involving price per unit and explains reasoning |
| M11_03 | Completes a table of equivalent proportions and percentages (2 of 2 points) |
| M11_03 | Partially completes a table of equivalent proportions and percentages (1 of 2 points) |
| M11_04 | Solves a word problem involving ratios |
| M12_05 | Solves a word problem involving ratios |
| M13_03 | Identifies a percentage using a given ratio |
| M07_05 | Identifies a true statement about percentages of given numbers |
| Algebra |  |
| M02_08 | Constructs a linear equation for the perimeter of a triangle and solves for the length of one side |
| M05_06 | Identifies an equivalent algebraic expression |
| M05_08 | Uses a given formula involving fractions to solve a word problem |
| M06_08 | Constructs a linear equation for the perimeter of a rectangle and finds the area (2 of 2 points) |
| M06_08 | Constructs a linear equation for the perimeter of a rectangle and finds the area (1 of 2 points) |

| M08_06 | Identifies an inequality that represents the relationship between the areas of two rectangles |
| :---: | :---: |
| M09_05 | Simplifies an algebraic expression |
| M09_08 | Constructs a linear equation for the perimeter of a triangle and solves for the length of one side |
| M10_07 | Adds two expressions with two variables and simplifies the result |
| M12_07 | Identifies a simplified expression equivalent to a given expression with parentheses |
| M14_08 | Identifies a simplified expression equivalent to a given expression with fractions and two variables |
| M14_09 | Identifies a pair of linear equations in two variables that represent a situation |
| M01_05 | Identifies an algebraic expression that represents the area of a given rectangle |
| M02_06 | Identifies an expression with parentheses equivalent to a given expression without parentheses |
| M04_07B | Identifies an inequality that represents a situation |
| M06_05 | Identifies an expression that represents a situation |
| M10_08 | Solves a word problem involving evaluating a formula with an exponent |
| M01_08 | Identifies the graph of a linear equation |
| M04_08B | Constructs an expression for the nth term of a geometric pattern |
| M05_09 | Demonstrates an understanding of slope by relating graphs and their equations |
| M06_06 | Constructs a linear equation to represent a situation |
| M08_08B | Extends a given geometric pattern to supply the value of the 50th term |
| M09_06 | Retrieves coordinate points from a graph of a function |
| M10_10 | Constructs an equation to describe the relationship between two quantities |

M12_09A Extends a given geometric pattern to supply the value of the 5th term

M12_09B Constructs an expression for the nth term of a geometric pattern
M13_06 Identifies the slope of a line given its equation

M02_09 Identifies a point that is collinear with three given collinear points

M03_06 Identifies a line with positive slope

## Geometry

M01_10 Determines the surface area of a prism given the dimensions of its net
M03_09 Uses properties of triangles and quadrilaterals to solve for an angle

M03_12 Draws rectangle on square grid given area and perimeter (2 of 2 points)
M04_09 Draws the image of a triangle translated horizontally and vertically on in the Cartesian plane
M04_10 Solves a two-step problem involving the area of a triangle inscribed in a square (2 of 2 points)
M04_10 Solves a two-step problem involving the area of a triangle inscribed in a square (1 of 2 points)

M05_11 Draws an angle of a given measure on a square grid
M06_10 Finds vertices of triangles created from trapezoids in the Cartesian plane (1 of 2 points)

M06_11 Uses properties of supplementary angles to solve for an angle

M07_09 Draws all lines of symmetry on a regular polygon
M10_11 Determines the area of a square given the side length of a regular hexagon with the same perimeter

M10_12 Solves a word problem involving circles and similar triangles
M11_10 Determines the number of faces of a solid with unit cubes removed

| M12_11 | Solves for a missing side length given two similar triangles in context |
| :--- | :--- |
| M13_08B | Solves a word problem involving the lateral surface area of a hexagonal prism |
| M13_10 | Solves a word problem involving the Pythagorean theorem |
| M14_11 | Uses properties of corresponding and supplementary angles to solve for an angle in a <br> geometric figure |
| M14_12 | Justifies that a right triangle and obtuse triangle with the same base and height have <br> the same area |
| M14_13 | Determines the surface area of a rectangular prism given its length, width, and height |
| M09_10 | Finds the coordinates of a vertex of a rectangle given the other three vertices |
| M01_13A | Uses and interprets data sets in pie charts to solve a problem involving percentages |
| M04_11 | Identifies relevant considerations for systematic data collection |
| M06_13B | Determines the change in a mean given changes in individual scores |
| M07_14 | Justifies a conclusion resulting from comparing two distributions |
| M09_12A | Calculates mean and median for two ordered list of data (2 of 2 points) |
| M14_16 | Explains the change in a mean given changes in individual values |
| M07_13 | Interprets data in a pictograph to solve a multi-step problem |
| M03_13 | Interprets a histogram to identify a proportion |
| Identifies the optimal data display to answer a given question |  |
| Compares observed and expected values |  |
| Computes the probability of an event given the number of each type of object in a set |  |

M04_12B Computes the probability of an event given the number of each type of object in a set

M09_13 Solves a multi-step problem involving probability
M13_13 Identifies the conditional probability of an event

Items Above Advanced International Benchmark (625)

## Number

M02_01 Recognizes equivalent expressions based on properties of operations (2 of 2 points)
M09_04 Given four different containers, identifies the container with the greatest fraction filled

M04_05 Given a ratio in a table, completes two equivalent ratios with one part missing in each

## Algebra

M03_05 Identifies the equivalent form of a linear inequality in one variable

M07_07 Identifies an algebraic expression involving parentheses and negative terms

M07_08 Solves a pair of simultaneous linear equations
M11_05 Identifies equivalent rational expressions

M01_07B Gives a rule for the nth term of a geometric pattern

M08_08C Constructs an expression for the nth term of a geometric pattern

M09_07 Determines a collinear point given another point on the line and the slope

## Geometry

| M01_09 | Identifies the image of a shape after rotation and reflection |
| :---: | :--- |
| M03_11 | Solves for a missing side length given two similar triangles |
| M06_09 | Estimates area of an irregular shape on a square grid |
| M06_10 | Finds the coordinates of the vertices of triangles created from trapezoids in the <br> Cartesian plane |
| M07_11 | Solves a multi-step word problem involving ratios between volumes |
| M08_09B | Uses the Pythagorean theorem to solve for a side length of a parallelogram and <br> calculates the perimeter (2 of 2 points) |
| M09_11 | Explains why two shaded areas of overlapping congruent triangles are equal <br> M12_12Solves a word problem involving a quarter of the circumference of a circle (2 of 2 <br> points) |
| M12_12 | Solves a word problem involving a quarter of the circumference of a circle (1 of 2 <br> points) |
| M13_09 | Determines the number of exposed faces for unit-cubes that make up a larger cube (2 <br> of 2 points) |

## Data and Probability

M03_13 Compares characteristics of two dot plots to justify a conclusion

M05_13 Explains why a data representation could be misleading

M08_11B Converts the value of a bar in a bar graph to a percent
M10_15 Compares data in two pie charts with different totals to refute a conclusion
M11_12 Solves a word problem involving averages

## Appendix 15D: Grade 8 Science Item Descriptions Developed During the TIMSS 2019 Benchmarking

## Items at Low International Benchmark (400)

## Biology

| S11_04 | Describes one characteristic of mammals that is advantageous for survival in cold <br> weather (1 of 2 points) |
| :---: | :--- |
| S01_01 | States one reason why male penguins' incubation behavior helps their eggs survive (1 of <br> 2 points) |
| S13_01B | Uses a food web to identify which organisms eat only plants |
| Chemistry |  |

S10_10 Identifies the form of wood that will burn fastest based on its size (1 of 2 points)

## Physics

S11_15 Recognizes whether an electromagnet would attract objects made of various materials

Earth Science
S10_15 States what must be removed from clean ocean water in order for a person to be able drink it

## Items at Intermediate International Benchmark (475)

## Biology

S12_03 Matches 4 of 5 organism groups to defining biological characteristics (1 of 2 points)
S09_04 Justifies an advantage of hollow bones for birds

S14_01 Evaluates a diagram to identify an advantage of a fish's field of vision

S06_04A Identifies one way that plant and animal cells are similar (1 of 2 points)

S13_04 Recognizes the functions of 2 of 4 tissues found in the human stomach (1 of 2 points)
S06_02 States one substance plants obtain from their environment and use in photosynthesis (1 of 2 points)

S09_03 Recognizes characteristics inherited by rabbits in a given context

S05_03B Reasons how a crocodile's angle of vision helps it to survive in the environment

S14_05 Identifies the rock layer containing the oldest fossils and justifies the choice

S10_05 Places four organisms in a model of an energy pyramid

S13_01A Uses a food web to identify which organisms are producers
S08_01 Identifies the best description of the advantages to bird and crocodile in the symbiotic relationship formed when a bird picks food from around a crocodile's teeth
S05_02 Analyzes information about an ecosystem and explains the effect of introducing a new population

S04_04 Explains how reducing the number of vehicles in a city center affects air quality

S07_01A Recognizes the agent that causes influenza

S14_02 Identifies diseases associated with 4 of 4 human behaviors

## Chemistry

S07_05Z From a list of symbols and formulas, recognizes which are elements and which are compounds
S01_07 Applies knowledge of concentration to explain why one solution is paler than another solution
S12_09 Explains that volume is one factor that can be used to identify the solution with a higher concentration of solute (1 of 2 points)

S07_07 Recognizes an everyday occurrence that is an example of a chemical change

S03_01 Recognizes a chemical process that involves the absorption of light

## Physics

S14_12
Identifies the glass of ice cubes that will melt faster based on the ice cubes' size (1 of 2 points)

S03_09 Recognizes the type of energy change that occurs as a child slides down a slide
S10_13 Recognizes 5 of 5 materials as conductors or insulators based on a graph showing the electric current in circuits containing the materials

S12_13B Identifies a statement describing the movement of a motorbike in a chronophotograph

S02_12 Recognizes why a vehicle has a different weight on Mars than it does on Earth

## Earth Science

S01_12 Recognizes the reason for cold temperatures outside an airplane in flight
S13_15 Synthesizes information in rainfall and temperature graphs to match 2 of 4 animals with the climate where they live (1 of 2 points)

S04_13 Identifies 5 or 6 of 7 activities as examples of reducing, reusing, or recycling (1 of 2 points)
S14_15 Interprets a diagram to identify the position of the Moon in orbit during a specific phase of the Moon

## Items at High International Benchmark (550)

## Biology

S04_01 Applies knowledge of mammals to identify how echidna differ from most mammals

S04_02 Identifies examples of animals belonging to 4 of 4 groups of organisms

S10_06 States one biological difference between fish and mammals (1 of 2 points)
S12_03 Matches 5 of 5 organism groups to defining biological characteristics (2 of 2 points)
S08_02 Identifies the body systems to which 4 of 4 organs belong

S09_02 Recognizes 2 of 3 major organs in a diagram (1 of 2 points)
S14_04 Explains why the percentage of oxygen differs in inhaled and exhaled air or why the percentage of nitrogen is the same in inhaled and exhaled air (1 of 2 points)
S11_04 Describes two characteristics of mammals that are advantageous for survival in cold weather (2 of 2 points)
S13_03 Predicts how heart rate changes in response to exercise, based on a set of given conditions

S04_03 Recognizes where new cells come from as an organism grows

S10_01 Identifies the functions of 5 of 5 human cell types (2 of 2 points)

S10_01 Identifies the functions of 4 of 5 human cell types (1 of 2 points)

S13_02 Explains how a fossil can be classified as plant or animal, based on its cellular structure

S01_02 Recognizes an organism that is made up of cells with cell walls

S08_03 Identifies an implication of removing a plant cell's chloroplasts

S09_01 Recognizes what happens to an animal's cells as it grows

S08_05 Identifies where DNA is located in a human body cell
S10_02 Identifies acquired characteristics of a pet bird
S06_03 Recognizes why rabbits inherit traits that their parents do not have
S14_03 Interprets a diagram to identify the source of DNA responsible for a plant's flower petal color
S12_05 Identifies the statement about python and boa evolution that is best supported by given information

S11_03 Identifies the conclusion best supported by a diagram of rock layers with embedded fossils

S01_03 Recognizes how decomposers get their energy
S02_03 Explains how roof gardens in cities help reduce the amount of carbon dioxide in the air

S12_01 States the part of tomato plant that releases the most water
S02_04 Recognizes an explanation for why the mass of leaves removed from a tree decreases over time
S01_04 Given a food chain, explains which organism competes most with humans in a farming community

S01_05Z For pairs of animals, distinguishes between predatory and competitive relationships
S08_06 Uses information in a table to explain why the abundance of one specie in an ecosystem changed between two given years (1 of 2 points)

S04_05 Interprets a food web to identify a predator/prey relationship
S02_01 Recognizes the relationship that occurs when insects that feed on nectar pollinate flowering plants
S03_06A Evaluates data from a table to draw a conclusion about the reason for a change in population of a species
S07_04 Explains how flooding leads to a shortage of drinking water or the spread of disease (1 of 2 points)

S11_02 Explains why it is unlikely for someone to get sick with the measles a second time
S03_05 $\begin{aligned} & \text { Selects and classifies } 3 \text { of } 4 \text { foods from a list that comprise a balanced diet (1 of } 2 \\ & \text { points) }\end{aligned}$ points)

S05_01 Recognizes which food is the best source of carbohydrates
S11_01 Recognizes a list of food that comprises a healthy, balanced meal

## Chemistry

S02_06 Identifies the subatomic particle that is locates outside of an atom's nucleus
S11_06 Identifies the number of atoms of each element in nitric acid
S03_02 Recognizes a model of a carbon dioxide molecule
S08_10 Identifies an explanation of how carbon dioxide can extinguish a fire
S12_07 Recognizes a chemical property

S10_08 Identifies a necessary property for a liquid in a thermometer
S04_08B States one variable to hold constant when investigating reactivity of different types of steel with water (1 of 2 points)

S07_10 Explains the effect of temperature on diffusion in the context of an investigation
S11_07 Uses data in a table to order set-ups according to the rate at which a solute will dissolve in water

S05_07 Recognizes a property that is common to both acids and bases

S05_08 Recognizes which process makes bronze dark and dull over time
S13_11 Explains whether a reaction between two solutions in a given context can occur a second time

S08_08 Interprets a diagram to identify the number of hydrogen atoms present before a chemical reaction

## Physics

S08_12 States that the amount of a substance present in its liquid form and present in its solid form is the same ( 1 of 2 points)
S02_11 Recognizes steps that should be taken to ensure an experiment will show whether iron or copper is the better conductor of heat
S09_05 Relates knowledge of heat transfer to recognize a graph that shows how two substances eventually reach temperature equilibrium

S13_07 Recognizes whether a red object will absorb or reflect different colors of light
S02_13 Applies knowledge of sound transmission to explain whether a ringing cell phone in a vacuum can be heard outside the vacuum chamber

S06_07 Recognizes which graph represents a musical note with given specifications for volume and pitch
S01_09B Explains that in a parallel arrangement of two bulbs, one bulb failing does not affect the other bulb

S08_14 Recognizes for 5 statements about magnets whether they are true or false

S01_10 Recognizes the best explanation of why two bar magnets repel each other
S04_12 States the force represented by an arrow in a diagram of a falling object

| S05_06 | Recognizes and explains which substance will float on water using a table of densities |
| :---: | :---: |
| S05_10 | Given the densities of two objects and three liquids, and diagrams showing the objects floating or sinking in the liquids, identifies each liquid |
| S10_11 | Explains how deploying a parachute slows a skydiver's fall |
| S13_06 | Relates knowledge of density to indicate the order in which three liquids will settle after being poured in a beaker |
| S06_08 | Recognizes a free-body diagram that has a total force acting towards the right |
| Earth Science |  |
| S13_14 | Recognizes sources of fresh and salt water in a diagram |
| S02_16 | Interprets a diagram to identify the natural resource that is formed during the process depicted |
| S06_01 | Recognizes the process in the water cycle indicated in a diagram of an ecosystem |
| S02_15 | Identifies evidence that the Earth is becoming warmer over time |
| S06_13A | Relates information in temperature graphs and maps to recognize climatic attributes of two cities |
| S11_11A | Interprets information in a climate graph to determine the warmest and driest month of the year |
| S13_13 | Identifies how the melting of permafrost can affect the Earth's climate |
| S13_15 | Synthesizes information in rainfall and temperature graphs to match 4 of 4 animals with the climates where they live ( 2 of 2 points) |
| S05_13 | Uses a graph of average monthly temperature to identify the city most likely to be located at the equator |
| S09_13 | Identifies a disadvantage of using solar energy |
| S04_14 | Recognizes the best explanation for why a river floods more often after a forest is cleared |
| S01_11B | Synthesizes information from tables about revolution times around and distances from the Sun to infer relative distances of planets from the Sun |
| S12_14 | Identifies the best explanation for why Saturn is visible from Earth |

## S01_11A <br> Uses information in a table with characteristics of planets to identify the planet with the

 shortest day lengthS04_15 Recognizes a description of how the Sun produces its own light

## Items at Advanced International Benchmark (625)

## Biology

## S02_05A Classifies 7 of 7 animals as mammals or nonmammals

S10_06 States two biological differences between fish and mammals (2 of 2 points)
S14_04 Explains why the percentage of oxygen differs in inhaled and exhaled air and why the percentage of nitrogen is the same in inhaled and exhaled air (2 of 2 points)
S07_02 Interprets a diagram to identify what happens to biceps and triceps when an elbow bends

S02_02 Recognizes where DNA replication takes place in an animal cell

S06_04A Identifies two ways that plant and animal cells are similar (2 of 2 points)

S06_04B States one way that plant and animal cells are different (1 of 2 points)
S13_04 Recognizes the functions of 4 of 4 tissues found in the human stomach (2 of 2 points)
S10_04 Identifies an explanation for why plants in a tank with woodlice grow faster than plants in a tank without woodlice

S10_03 Identifies the tube containing two substances bacteria need for cellular respiration

S12_06 Identifies how fermentation differs from typical cellular respiration

S05_04 States one similarity between the life cycles of a bird and a frog
S07_03 Recognizes a human characteristic that is acquired
S01_01 States two reasons why male penguins' incubation behavior helps their eggs survive (2
of 2 points)

| S05_03A | Justifies a statement about crocodiles' adaptation to their environment, based on given <br> facts |
| :--- | :--- |
| S03_04 | Applies knowledge about the theory of evolution to identify the best conclusion <br> supported by a diagram of limbs from different animals |
| S08_04 | Identifies where the largest energy transfer occurs in an energy pyramid |
| S11_05 | Recognizes an example of a symbiotic relationship between two organisms |
| S03_06B | Selects and evaluates data from a table to draw a conclusion about the likely reason for <br> a change in population of a species |
| S12_02 | States two ways that planting trees is beneficial for the environment |
| Identifies a human activity that can increase the amount of nutrients in a pond |  |
| S14_07 | Recognizes the function of white blood cells in the human immune system |

## Chemistry

S04_07 States the subatomic particle that is not included in a diagram of an atom

S06_11 Recognizes what happens to the atoms in an object pounded flat
S09_08 Recognizes whether 4 of 5 substances are elements, compounds, or mixtures (1 of 2 points)
S02_07 Uses a portion of the periodic table to order four elements from the smallest atomic number to the largest atomic number

S14_08 Uses atomic numbers to identify the position of 4 of 4 elements in a portion of the periodic table

S10_09 Identifies a similarity between two elements in the same group of the periodic table

S04_08A
Explains how measuring the amount of rust on discs made from different types of steel will show which type of steel is more reactive with water
S07_06 Identifies an element as a metal or a nonmetal, based on a list of physical properties and predicts one additional property

S14_09 Compares/contrasts substances in a table to identify the property used to sort them into two groups

S03_03 Applies knowledge of density to identify and explain which liquid will leave a dropper first after a mixture separates

S12_08
Identifies pieces of equipment that could be used to separate and collect substances from 4 of 4 mixtures

S12_09 Applies knowledge of concentration to identify the cup of tea with the higher concentration of sugar (2 of 2 points)
S09_11 Explains whether a reaction took place after a pH indicator is added to a solution based on information provided about the indicator

S09_10 Identifies and explains whether a described change is physical or chemical

S06_10 Recognizes which model best illustrates the results of a chemical reaction

S12_10 Identifies the statement that best describes what occurs when iron sulfide is formed

## Physics

S02_10 Recognizes a diagram of what happens to gas molecules inside a balloon when the balloon expands

S06_09 Explains the difference between a solid and air in terms of particle spacing in context
S11_13 Draws a conclusion about the states of substances in two pistons, based on the different amounts of compression that occurred

S05_09 Recognizes why gases are easier to compress than solids and liquids
S12_11 Recognizes what happens to water molecules in an ice cube when the ice cube melts
S14_11 Interprets a temperature graph to identify the process happening in a given section of the graph
S08_12 Applies the law of conservation of mass to compare the mass of a substance before and after a state change (2 of 2 points)

S01_08 Recognizes an everyday process that is an example of a physical change

S06_05 Recognizes how the mass of a metal ball will change as it cools down
S11_14 Recognizes the type of energy transformation that occurs when a car begins to move from rest
S10_12 Recognizes an experimental design that will determine whether an aluminum, iron, or ceramic bar conducts heat the fastest

| S09_07 | Recognizes an explanation for why a ball appears a certain color in a given context |
| :--- | :--- |
| S04_11 | Uses a diagram to determine a position where an observer's shadow would not fall on a <br> monument |
| S03_07 | Recognizes which property of sound allows animals to navigate and find food |
| S14_13 | Identifies a description of the relationship between sounds made by the longest and <br> shortest bars on a xylophone |
| S01_09A | States one reason why a bulb in a diagram of an electrical circuit does not light |
| S08_13 | Identifies the components that must be included in a circuit that will turn a bell on and <br> off |
| S01_09C | Recognizes a correct statement about battery life and bulb brightness in two given <br> electrical circuits |
| S07_09 | Recognizes how to increase the strength of an electromagnet |
| S08_11 | States the two measurements needed to calculate average speed in an everyday <br> context |
| S03_10 | Identifies the movement of a motorbike in a chronophotograph and explains how the <br> chronophotograph reveals the motorbike's movement |
| Sdeavifies and explains which of three methods will require the smallest force to move a |  |
| S0nto a truck |  |

S09_14A Recognizes the process that forms rock layers

S14_14 Recognizes climatic conditions that cause rock to erode the fastest
S03_13 Uses a diagram of a mountain range on the ocean and a given wind direction to recognize which location will have the greatest rainfall

S07_12 Recognizes the source of energy for the water cycle

S04_13 Identifies 7 of 7 activities as examples of reducing, reusing, or recycling (2 of 2 points)
S06_12 Describes one geographic factor to consider when selecting a safe location for a nuclear power plant

S07_13 Explains one way trees protect soil from erosion
S13_12 Recognizes a negative effect that fertilizer can have on the environment
S08_17 Recognizes the main cause of water level changes in a harbor over the course of 24 hours

S07_14 Justifies a claim that the Moon travels around the Sun

## Items Above Advanced International Benchmark (625)

## Biology

S02_05B States the biological characteristic used to distinguish vertebrates from invertebrates

S09_02 Recognizes 3 of 3 major organs in a diagram (2 of 2 points)

S06_04B States two ways that plant and animal cells are different (2 of 2 points)
S06_02 States two substances plants obtain from their environment and use in photosynthesis (2 of 2 points)

S05_05 Identifies an explanation for disappearance of a trait over generations
S04_06 Identifies where the carbon in wood comes from

| S08_06 | Uses information in a table to explain why the abundance of two species in an ecosystem changed between two given years (2 of 2 points) |
| :---: | :---: |
| S03_06C | Predicts which species would best survive in a given environment, using information in a table, and provides a supporting explanation |
| S07_04 | Explains how flooding leads to a shortage of drinking water and the spread of disease (2 of 2 points) |
| S07_01B | Explains how influenza can be spread rapidly around the world |
| Chemistry |  |
| S13_10 | Recognizes a true statement about neutral atoms |
| S09_08 | Recognizes whether each of five substances is an element, a compound, or a mixture (2 of 2 points) |
| S04_08B | States two variables to hold constant when investigating reactivity of different types of steel with water (2 of 2 points) |
| S08_07 | Evaluates whether a series of steps will separate a mixture of salt, sand, and iron |
| S02_08 | Interprets information in a table to determine if 3 of 3 solutions are acidic, basic, or neutral |
| S02_09 | Recognizes the reason for a temperature increase when an acid and base are combined |
| S04_09 | Identifies and explains the solution that should be combined with an acidic solution to neutralize it |
| S11_08 | Recognizes a property of a basic solution |
| S14_10 | Predicts the color of flowers that are produced when peat moss is added to soil with a given pH |
| S13_09 | Explains how painting a metal prevents rust from forming |
| S10_10 | Identifies the form of wood that will burn fastest based on its surface area (2 of 2 points) |
| Physics |  |
| S07_08 | Recognizes the property of a gas in a dented ping pong ball that stays constant if the ball is heated |
| S09_09 | Explains how a substance can be in two different states in a container at one time in a given context |

S14_12 Identifies the glass of ice cubes that will melt faster based on the ice cubes' surface area (2 of 2 points)
S10_14 Recognizes the position in a diagram where a thrown stone has the greatest kinetic energy

S03_08 Recognizes how the temperature of water changes over time when heated
S04_10 Interprets a graph to identify the description of how heat is transferred between a substance and its surroundings

S06_06 Uses a diagram to explain one way to increase the strength of an electromagnet
S09_06 Explains why a vehicle with tires is more likely to sink in the mud than a vehicle with treads

## Earth Science

S14_16 Recognizes the diagram that best represents the structure of the Earth
S11_10 Recognizes the relative composition of gases in Earth's atmosphere

S09_14B Given a diagram, explains a process that shaped a rock formation in the ocean

S11_09 Recognizes how oil is formed on Earth
S06_13B Synthesizes information in temperature graphs and maps to recognize an explanation for the difference in seasonal climates of two cities at similar latitudes
S10_16 Identifies best explanation for why temperatures are hotter in a city center than in a meadow

S11_11B Evaluates a conclusion about climate data, based on one week of weather observations

S08_16 Explains why oil, gas, and coal are nonrenewable resources

S08_15 Evaluates what kind of area would benefit most from a desalination plant

S05_14
Identifies an explanation for why a constellation visible one night is no longer visible six months later

## CHAPTER 16

## Creating and Interpreting the TIMSS 2019 Context Questionnaire Scales

Liqun Yin
Bethany Fishbein

## Overview

As described in Chapter 2, many of the TIMSS 2019 context questionnaire items were developed and updated to be combined into scales measuring a single underlying latent construct. While some of these scales measuring particular factors or constructs have been of interest for several TIMSS assessment cycles, others were developed in TIMSS 2019 to reflect current research or collect useful information of interest in important areas, such as enhancing the measures of teacher instructional quality. For reporting, the scales were constructed using item response theory (IRT) scaling methods, specifically the Rasch partial credit model (Masters, 1982; Masters \& Wright, 1997). For certain scales that maintained many of the same items across TIMSS 2015 and TIMSS 2019, the scales were linked to allow for trend measurement on the background construct.

As a parallel to the TIMSS International Benchmarks of achievement, each context scale allowed students to be classified into regions corresponding to high, middle, and low values on the construct. To facilitate interpretation of the regions, the cutpoints on the scale delimiting the regions were described in terms of combinations of response categories.

This chapter describes the procedures for constructing, interpreting, and validating scales based on responses to student, home, school, and teacher questionnaires, and then details the process for linking and reporting trend scales.

## Reporting TIMSS 2019 Context Questionnaire Scales

As an example illustrating the TIMSS approach to reporting context questionnaire data, Exhibit 16.1 presents the TIMSS 2019 Instructional Clarity in Mathematics Lessons scale at the eighth grade, a scale that was reported for the first time for the TIMSS 2019 assessment. As the name suggests, this scale seeks to measure students' perceptions about the clarity of instruction in their mathematics lessons based on
their responses to seven statements. For each of the seven statements, students were asked to indicate the degree of their agreement with the statement: agree a lot, agree a little, disagree a little, or disagree a lot. Using the IRT partial credit model, the data from student responses were placed on a scale constructed so that the scale centerpoint of 10 was located at the mean score of the combined distribution of all TIMSS 2019 eighth grade countries. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

Students who were classified as having "high clarity of instruction" in their mathematics lessons are those with a scale score greater than or equal to a cutpoint defined for the scale, 10.3 in this case, corresponding to "agreeing a lot" with four of the seven statements and "agreeing a little" with the other three statements, on average. Students who were classified as having "low clarity of instruction" in their mathematics lessons had a score no higher than a cutpoint of 7.8, corresponding to "disagreeing a little" with four of the statements, and "agreeing a little" with the other three, on average. All other students, i.e., those with scores greater than 7.8 but lower than 10.3 , were considered to report "moderate clarity of instruction."

Exhibit 16.1: Items in the TIMSS 2019 Instructional Clarity in Mathematics Lessons Scale—Grade 8

## Scaling Procedure for Context Questionnaire Scales

Partial credit IRT scaling is based on a latent variable model that relates the probability that a person will choose a particular response to an item to that person's location on the underlying construct.

The partial credit model (Masters, 1982) is shown below:

$$
\begin{equation*}
P_{i}\left(x \mid \theta_{n}\right)=\frac{e^{\sum_{j=0}^{x}\left(\theta_{n}-\delta_{i}+\tau_{i j}\right)}}{\sum_{h=0}^{m_{i}} e^{\sum_{j=0}^{h}\left(\theta_{n}-\delta_{i}+\tau_{i j}\right)}} \quad x=0,1, \ldots, m_{i} \tag{16.1}
\end{equation*}
$$

where $P_{i}\left(x \mid \theta_{n}\right)$ denotes the probability that person $n$ with location $\theta_{n}$ on the latent construct would choose response category $x$ on item $i$ out of the $\left(m_{i}+1\right)$ possible response levels for the item. The item parameter $\delta_{i}$ gives the location of the item on the latent construct and the $\tau_{i j}$ denote step parameters for the response levels. Masters (1982) uses a somewhat different parameterization, namely $b_{i j}=\delta_{i}-\tau_{i j}$ (see also Chapter 11 in this volume). For each scale, the scaling procedure involves first estimating the $\delta_{i}$ and $\tau_{i j}$ item parameters at the international level, and then using the model with these parameters to estimate $\theta_{n}$, the score on the latent construct, for each on the $n$ respondents. Depending on the scale, respondents may be students, parents, teachers, or school principals.

In the TIMSS 2019 eighth grade Instructional Clarity in Mathematics Lessons scale, the underlying construct is students' perceptions about the clarity of instruction in their mathematics lessons, and students who agree in general with the seven statements are assumed to perceive more instructional clarity, and students who disagree with the statements are assumed to perceive less clarity.

The TIMSS 2019 context questionnaire scaling was conducted using the ConQuest 2.0 software (Wu, Adams, Wilson, \& Haldane, 2007). In preparation for the context questionnaire scaling effort, the TIMSS \& PIRLS International Study Center developed a system of production programs for calibration of the items on each scale using ConQuest and produce scale scores for each scale respondent. Each assessment population (TIMSS fourth grade, TIMSS eighth grade) consisted of approximately 300,000 students, as well as their parents, teachers, and school principals. The estimation of the item parameters, a procedure also known as item calibration, was conducted on the combined data from all countries, regardless of whether they participated in eTIMSS or paperTIMSS in 2019, with each country contributing equally to the calibration. This was achieved by assigning 'senate weights', i.e., sampling weights that sum to 500 for each country's student data.

Exhibit 16.2 shows the international item parameters for the Instructional Clarity in Mathematics Lessons scale at the eighth grade. For each item, the delta parameter $\delta_{i}$ shows the estimated overall location of the item on the scale, and the tau parameters $\tau_{i j}$ show the location of the steps, expressed as deviations
from delta. In ConQuest, there are two options on the constraints, either on items or on cases, to remove scale indeterminacy in calibration. In TIMSS 2019 context scale calibrations, the constraints on items were used to identify the model by setting the mean of the item difficulty parameters to zero. As it is shown in Exhibit 16.2, the sum of all $\delta_{i}$ is 0 for the Instructional Clarity in Mathematics Lessons scale.

In addition, included in the right column is the Rasch infit item statistic, which is a measure of how accurately the model fits the data, with values ranging from 0 to infinity with a value of 1.0 corresponding to optimal fit. Bond \& Fox (2001) provide rules of thumb from a practical perspective and consider a range 0.6 to 1.4 for this measure to support an appropriate level of fit for the measurement of survey data using Likert and other rating scales. As can be seen in this exhibit, the infit values obtained for the scale support appropriate fit of the model for the Instructional Clarity in Mathematics Lessons scale.

Exhibit 16.2: Item Parameters for the TIMSS 2019 Instructional Clarity in Mathematics Lessons Scale-Grade 8

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| BSBM17A | 0.05459 | -1.49723 | -0.59435 | 2.09158 | 1.43 |
| BSBM17B | 0.32080 | -1.45404 | -0.41713 | 1.87117 | 0.92 |
| BSBM17C | 0.00334 | -1.36560 | -0.33731 | 1.70291 | 0.81 |
| BSBM17D | -0.11300 | -1.01045 | -0.39445 | 1.40490 | 0.77 |
| BSBM17E | -0.03564 | -1.22811 | -0.35992 | 1.58803 | 0.93 |
| BSBM17F | 0.11754 | -1.42524 | -0.44389 | 1.86913 | 1.04 |
| BSBM17G | -0.34763 | -0.88348 | -0.46134 | 1.34482 | 0.99 |

Once the calibration was completed and international item parameters were estimated, individual scores for each respondent (students, teachers, principals, or parents) were estimated using weighted maximum likelihood estimation (Warm, 1989). All cases with valid responses to at least two items on a scale were included in the calibration and scoring processes.

The scale scores produced by the weighted likelihood estimation are in the logit metric with estimated values ranging from approximately -5 to +5 . To convert to a more convenient reporting metric for the newly constructed scales, a linear transformation was applied to the international distribution of logit scores for each scale, so that the resulting distribution across all countries had a mean of 10 and a standard deviation of 2 . As an example, Exhibit 16.3 presents the scale transformation constants applied to the international distribution of logit scores for the Instructional Clarity in Mathematics Lessons scale at the eighth grade to transform them to the $(10,2)$ reporting metric. Each scale was transformed using a different set of transformation constants (not reported here as they do not carry specific meaning) in order to put the estimates on the reporting scale to match the targets of an average of 10 and standard deviation of 2 .

## Exhibit 16.3: Scale Transformation Constants for the TIMSS 2019 Instructional Clarity in Mathematics Lessons Scale—Grade 8

## Scale Transformation Constants

$\mathrm{A}=8.053331$<br>$B=1.109981$

To provide an approach to reporting the context questionnaire scales analogous to the TIMSS International Benchmarks for the TIMSS achievement scales, a method was developed to divide each scale into high, middle, and low regions and provide a content-referenced interpretation for these regions. For the TIMSS achievement scales, the Low, Intermediate, High, and Advanced International Benchmarks are specific reference points on the scale that can be used to monitor progress in student achievement. Using a scale anchoring procedure, as described in Chapter 15, student performance at each benchmark is described in terms of the mathematics and science (depending on the subject) that students reaching that benchmark know and can do. The percentage of students reaching each of these international benchmarks can serve as a profile of student achievement in a country.

For the high, middle, and low regions of the context questionnaire scales, the interpretation is content-referenced to the extent that the boundaries of the regions were described in terms of identifiable combinations of response categories. The particular response combinations that defined the regions boundaries, or cutpoints, were based on a judgment by TIMSS \& PIRLS International Study Center staff of what constituted a high or low region on each individual scale. For example, based on a consideration of the questions making up the Instructional Clarity in Mathematics Lessons scale, it was determined that in order to be in the high region of the scale and labeled "high clarity of instruction," a student would have to "agree a lot", on average, to at least four of the seven statements and "agree a little" with the other three. Similarly, it was determined that a student who, on average, at most "disagreed a little" with four of the statements and "agreed a little" with the other three would be labeled to have "low clarity of instruction."

The scale region cutpoints were quantified by assigning a numeric value to each response category, such that each respondent's responses to the scale's questions could be expressed as a "raw score." Assigning 0 to "Disagree a lot," 1 to "Disagree a little," 2 to "Agree a little," and 3 to "Agree a lot," results in raw scores on the Instructional Clarity in Mathematics Lessons scale ranging from 0 (disagree a lot with all seven statements) to 21 (agree a lot to all seven). A student who "agreed a lot" with four statements and "agreed a little" with the other three would have a raw score of $18(4 \times 3+3 \times 2)$. Following this approach, a student with a raw score of 18 or more would be in the "high clarity of instruction" region of the scale. Similarly, "agreeing a little" with three statements and "disagreeing a little" with four statements would result in a raw score of $10(3 \times 2+4 \times 1)$, so that a student with a raw score less than or equal to 10 would be in the "low clarity of instruction" region. Students with raw scores between 10 and 18 were assigned to the "moderate clarity of instruction" region.

A property of a Rasch scale is that each raw score has a unique scale score associated with it. Exhibit 16.4 presents a raw score-scale score equivalence table for the Instructional Clarity in Mathematics Lessons scale at the eighth grade. From this table, it can be seen that, for this particular scale, a raw score of 10 corresponds to a scale score of 7.8 (rounding up) and a raw score of 18 corresponds to a scale score of 10.3 (rounding down) for this particular scale. ${ }^{1}$ These scale scores were the cutpoints used to divide the scale into the three regions.

Exhibit 16.4: Equivalence Table of Raw and Transformed Scale Scores for the TIMSS 2019 Instructional Clarity in Mathematics Lessons Scale—Grade 8

## Linking Procedures for Trend Context Questionnaire Scales

Using context questionnaire IRT scales to measure contextual constructs started with TIMSS 2011, and during the development phase of the TIMSS 2015 questionnaires, a conscious effort was made to increase the number of items contributing to each scale in order to enhance scale reliability. As described in Chapter 2, many of the scales included in the TIMSS 2019 context questionnaires were brought forward from 2015 because they addressed home and school factors that have been of interest for several TIMSS assessments and were relatively stable across successive cycles. These scales were either brought forward in their entirety or modified for the TIMSS 2019 assessment cycle. The scales with no changes or with minor to moderate modifications were considered as trend scales. Linking procedures were then implemented on these trend scales to place the context questionnaire data from the two or three cycles on a common metric, depending on whether the common reporting metric was established in 2011 or in 2015. This section describes the linking procedures for placing data for the TIMSS 2019 context questionnaire scales onto the trend reporting metric and validating this process.

The trend context scales in TIMSS 2019 have items common to both TIMSS 2015 and TIMSS 2019, called trend items, and some new items unique to TIMSS 2019. Generally, a context questionnaire scale was considered as trend in 2019 if it had a sufficient number of items in common with TIMSS 2015: a minimum of 5 common items and more than half of the TIMSS 2019 items being common items. However, all separate science scales at the eighth grade (biology, chemistry, physics, earth sciences) were treated as new scales in 2019 even if most items were common to the TIMSS 2015 versions of those scales. The number of trend countries for separate science scales was relatively small. Linking the scales using limited trend countries across cycles was deemed less beneficial than providing scale cut points that best reflect the distribution of all countries using separate science scales for each cycle separately.

In TIMSS 2019, 18 fourth grade and 16 eighth grade context questionnaire scales were specified as trend scales. Exhibit 16.5 lists the trend context scales in TIMSS 2019 for both the fourth grade and the eighth grade.

Exhibit 16.5: Trend Context Scales in TIMSS 2019

As an example, Exhibit 16.6 shows the TIMSS 2019 Students Confident in Mathematics scale for fourth grade students. This scale was originally established in TIMSS 2011, and measures how confident students feel about their ability in mathematics, in terms of their level of agreement with nine statements about mathematics. Statements expressing negative sentiment were reverse coded during the scaling. All of the nine statements were common to the TIMSS 2015 and TIMSS 2019 versions of this scale.

Exhibit 16.6: Items in the TIMSS 2019 Students Confident in Mathematics Trend Scale—Grade 4

The IRT calibration and scoring procedures for trend scales were the same as those used for the newly developed context scales. The data for these nine items were calibrated across all TIMSS 2019 countries using the Rasch partial credit model, and, through this calibration, item parameters were estimated on a logit scale that was unique to the 2019 assessment cycle. Following calibration, weighted maximum likelihood estimation was used to derive Rasch logit scale scores based on these estimated item parameters for all countries and benchmarking participants, and as such, student scores were placed on this 2019 logit metric. Although similar, the TIMSS 2019 logit metric is not identical to the TIMSS 2015 logit metric, especially for the scales with items modified or new items added, and thus the TIMSS 2019 scores needed to be adjusted to the 2015 metric to allow for trend linking.

This linking was achieved through a two-step transformation process. The first transformationwith linear constants $A_{1}$ and $B_{1}$-placed the TIMSS 2019 logit scale scores on the TIMSS 2015 logit metric, and the second transformation—with linear constants $A_{2}$ and $B_{2}$-transformed the TIMSS 2015 logit metric to the TIMSS scale reporting metric, which uses the $(10,2)$ metric established in 2011. To increase the efficiency of this transformation process and reduce rounding errors, both transformations were combined into one calculation using the equations below to create a set of final scale transformation constants, $A$ and $B$ :

$$
\begin{gather*}
B=B_{2} \cdot B_{1}  \tag{16.2}\\
A=A_{2}+B_{2} \cdot A_{1} \tag{16.3}
\end{gather*}
$$

The first set of transformation parameters, $A_{1}$ and $B_{1}$, were obtained by applying the mean/sigma method (Kolen \& Brennan, 2004; Marco, 1977) to the two sets of common item parameters: one from the current calibration of TIMSS 2019 context data and the other from the previous calibration of TIMSS 2015 data. The mean and standard deviation of the estimates of the threshold parameters (Masters, 1982), that is, the difference between item location and item step parameter, $\left(b_{i j}=\delta_{i}-\tau_{i j}\right)$, were first found over all common items and all categories for each calibration. The transformation parameters $A_{1}$ and $B_{1}$ were calculated based on these two sets of means and standard deviations:

$$
\begin{gather*}
B_{1}=\frac{S D_{c 15}}{S D_{c 19}}  \tag{16.4}\\
A_{1}=M N_{c 15}-\frac{S D_{c 15}}{S D_{c 19}} \cdot M N_{c 19} \tag{16.5}
\end{gather*}
$$

where $M N_{c 19}$ and $S D_{c 19}$ are the mean and standard deviation of the estimates of $\left(b_{i j}=\delta_{i}-\tau_{i j}\right)$ of all common items and categories from the current calibration on TIMSS 2019 data; $M N_{c 15}$ and $S D_{c 15}$ are the mean and standard deviation of the estimates of $\left(b_{i j}=\delta_{i}-\tau_{i j}\right)$ of all common items and categories from the previous calibration on TIMSS 2015 data.

The second set of transformation parameters, $A_{2}$ and $B_{2}$, were retrieved from the scale transformations produced in 2015. This transformation aimed to place the resulting Rasch scores on the TIMSS reporting metric (10, 2). When the scale started in TIMSS 2015, the second set of transformation parameters were produced in 2015 by simply transforming TIMSS 2015 Rasch logit scores on the (10, 2) scale reporting metric.

The Exhibit 16.7 presents the final trend scale transformation constants applied to the TIMSS 2019 international distribution of logit scale scores for the fourth grade Students Confident in Mathematics trend scale to transform them to the $(10,2)$ reporting metric.

## Exhibit 16.7: Scale Transformation Constants for the TIMSS 2019 Students Confident in Mathematics Scale-Grade 4

## Scale Transformation Constants

$A=8.556200$
$B=1.689256$$\quad$ Transformed Scale Score $=8.556200+1.689256 \cdot$ Logit Scale Score

To validate the trend measurement on the scales, the TIMSS \& PIRLS International Study center conducted extensive analysis to examine item behavior in both cycles. To assess the accuracy of the linking, item parameter estimates for the trend items were compared across the two cycles by examining the differences between the TIMSS 2019 item parameter estimates after being transformed to the TIMSS 2015 logit metric, and the TIMSS 2015 item parameter estimates on the 2015 logit scale. The transformation parameters used for transforming item parameters and this evaluation purpose were the same as those for linking the TIMSS 2019 Rasch scale scores to the TIMSS 2015 logit metric, $A_{1}$ and $B_{1}$, as described above. Exhibit 16.8 presents the differences between these estimates for the fourth grade Students Confident in Mathematics trend scale. As can be seen in the exhibit, the differences were at an acceptable level for both location and step parameters, with most deviations being less than 0.1.

## Analyzing Trends on the TIMSS 2019 Context Questionnaire Scales

The resulting trend scale scores are comparable to the scales scores in previous cycles, TIMSS 2015, or both TIMSS 2015 and TIMSS 2011 if the trend metric was established in TIMSS 2011. However, trend analyses with the TIMSS context questionnaire scales should be conducted with caution, as observed differences in the scale scores across TIMSS cycles may not be meaningful for all countries. The psychometric behavior of the contextual scales may vary when the group of participating countries varies between successive cycles (as it is the case for the eighth grade separate science scales), and the scales may behave differently across cultures. In addition, the psychometric behavior of the scales within any
given country may not remain stable, as linking the TIMSS 2019 scales to TIMSS 2015 did not account for any differences in national translations or adaptations between the two cycles.

Trend results cannot be analyzed using the percentage of students in each benchmark region. For trend scales, the raw cut points were re-defined in each TIMSS assessment cycle because the number of component variables in the scales would likely change when the scales were modified across cycles. To facilitate interpretation of the region boundaries in terms of combinations of response categories, trend scales followed the same procedure as non-trend scales in setting cutpoints for classification into regions. As such, the procedure was primarily dependent on similarities in response patterns without taking into account variations in difficulty across the items that were unique to 2015 or 2019.

## Reliability and Validity of the TIMSS 2019 Context Questionnaire Scales

As evidence that the context questionnaire scales provide comparable measurement across countries, reliability coefficients were computed for each scale for every country and benchmarking participant, and a principal component analysis (Hotelling, 1933) of the scale items was conducted. Exhibit 16.9 presents the results of this analysis for the fourth grade Students Confident in Mathematics scale. The Cronbach's Alpha reliability coefficients generally were at an acceptable level (Peterson, 1994; Taber, 2017), with almost all above 0.7 and many above 0.8 . The exhibit also shows the percentage of variance among the scale items accounted for by the first principal component in each country. In most cases this was acceptably high, indicating that the items could be adequately represented by a single scale. The component loadings of each questionnaire item from the principal component analysis are positive and substantial, indicating a strong correlation between each item and the scale in every country.

As indicators of effective environments for learning, a positive relationship with achievement is an important aspect of validity for the TIMSS context questionnaire scales. For the fourth grade Students Confident in Mathematics scale, Exhibit 16.10 presents the Pearson correlation with mathematics achievement in TIMSS 2019 for each country, together with $r$-squared-the proportion of variance in mathematics achievement attributable to the scale. These figures show a moderate relationship with achievement across participating countries. Also shown is the proportion of variance in achievement attributable to differences between the regions of the Students Confident in Mathematics scale. This is very similar to the proportion of variance explained by the scale as a whole, indicating that dividing the scale into regions loses little of its power to account for achievement differences.

Item parameter estimates and item and scale statistics similar to those above are available in Appendix 16A for each of the fourth grade TIMSS 2019 context questionnaire scales and in Appendix 16B for each of the eighth grade context questionnaire scales. In both Appendices, scales based on students' reports are listed first, followed by principals' reports, then teachers' reports.

## Scales Based on Students' and Parents' Reports

## Disorderly Behavior During Mathematics Lessons - Grade 4

## About the Scale

The Disorderly Behavior During Mathematics Lessons scale was created based on students' responses to six items listed below.

Item Parameters for the TIMSS 2019 Disorderly Behavior During Mathematics Lessons Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| ASBM04A | 0.06260 | -0.67190 | -0.64661 | 1.31851 | 1.06 |
| ASBM04B | 0.15853 | -0.46978 | -0.54643 | 1.01621 | 0.94 |
| ASBM04C | -0.43410 | -0.26438 | -0.23380 | 0.49818 | 1.01 |
| ASBM04D | 0.06350 | -0.10998 | -0.60607 | 0.71605 | 0.91 |
| ASBM04E | -0.09436 | -0.22110 | -0.59219 | 0.81329 | 0.90 |
| ASBM04F | 0.24383 | 0.10650 | -0.79706 | 0.69056 | 1.29 |

Scale Transformation Constants for the TIMSS 2019 Disorderly Behavior During Mathematics Lessons Scale - Grade 4

## Scale Transformation Constants

| $A=9.816113$ | Transformed Scale Score $=9.816113+1.569359 \cdot$ Logit Scale Score |
| :---: | :---: |
| $B=1.569359$ |  |

Equivalence Table of the Raw Score and Transformed Scale Scores for the TIMSS 2019 Disorderly Behavior During Mathematics Lessons Scale - Grade 4

## Early Literacy and Numeracy Tasks - Grade 4

## About the Scale

The Early Literacy and Numeracy Tasks scale was created based on parents' responses to twelve items listed below.

ASBH06A T
ASBH06B T
ASBH06C T
ASBH06D ${ }^{\top}$
ASBH06E T
ASBH06F
ASBH06G

ASBH07A T
ASBH07B T
ASBH07C T

ASBH07D ${ }^{\top}$
ASBH07E ${ }^{\top}$

How well could your child do the following when he/she began the first grade of
primary/elementary school?

Could your child do the following when he/she began the first grade of primary/elementary school?

1) Count by himself/herself
2) Recognize written numbers ------------ -
3) Write numbers

Could your child do the following when he/she began the first grade of primary/elementary school?

[^27]Item Parameters for the TIMSS 2019 Early Literacy and Numeracy Tasks Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 |

## Home Resources for Learning - Grade 4

## About the Scale

The Home Resources for Learning scale was created based on students' and parents' reports regarding the availability of five resources listed below.

ASBG04 ${ }^{\top} \quad$ Number of books in the home (students):

1) $0-10$
2) $11-25$
3) $26-100$
4) $101-200$
5) More than 200

Number of home study supports (students):

1) None
2) Internet connection or own room
3) Both internet connection and own room

Number of children's books in the home (parents):

1) $0-10$
2) $11-25$
3) $26-50$
4) $51-100$
5) More than 100

Highest level of education of either parent (parents):
ASDHEDUP ${ }^{\text {T } 1}$

1) Finished some primary or lower secondary or did not go to school
2) Finished lower secondary
3) Finished upper secondary
4) Finished post-secondary education
5) Finished university or higher

Highest level of occupation of either parent (parents):

1) Has never worked outside home for pay, general laborer, or semi-professional (skilled agricultural or
fishery worker, craft or trade worker, plant or machine operator)
2) Clerical (clerk or service or sales worker)
3) Small business owner
4) Professional (corporate manager or senior official, professional, or technician or associate professional)

## Instructional Clarity in Mathematics Lessons - Grade 4

## About the Scale

The Instructional Clarity in Mathematics Lessons scale was created based on students' responses to six items listed below.

ASBM03A
ASBM03B
ASBM03C

ASBM03D
ASBM03E
ASBM03F

How much do you agree with these statements about your mathematics lessons?

1) I know what my teacher expects me to do ---
2) My teacher is easy to understand -------- .
3) My teacher has clear answers to
my questions-----------------------
4) My teacher is good at explaining mathematics -
5) My teacher does a variety of things to help us learn
Agree
a lot a lot
 a little

6) My teacher explains a topic again when we don't understand ------------------ --

don't understand---------------------

6.8

## Parents' Perceptions of Their Child's School - Grade 4

## About the Scale

The Parents' Perceptions of Their Child's School scale was created based on students' responses to eight items listed below. ${ }^{1}$

${ }^{1}$ For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Disagree a little" and "Disagree a lot" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.
${ }^{\top}$ Trend item-item was included in the same scale in TIMSS 2015 and was used for linking the TIMSS 2015 and TIMSS 2019 scales.

## Student Bullying - Grade 4

## About the Scale

The Student Bullying scale was created based on students' responses to eleven items listed below.

ASBG11A
ASBG11B
ASBG11C
ASBG11D
ASBG11E
ASBG11F
ASBG11G
ASBG11H
ASBG11I
ASBG11J
ASBG11K
During this school year, how often have other students from your school done any of the following things to you, including through texting or the Internet?

Item Parameters for the TIMSS 2019 Student Bullying Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| ASBG11A | 0.70887 | 0.25598 | -0.31167 | 0.05569 | 1.10 |
| ASBG11B | 0.49313 | 0.00135 | -0.01632 | 0.01497 | 1.19 |
| ASBG11C | 0.43075 | 0.05672 | -0.08605 | 0.02933 | 1.03 |
| ASBG11D | 0.00016 | 0.34024 | -0.14813 | -0.19211 | 1.07 |
| ASBG11E | -0.08448 | 0.35351 | -0.03527 | -0.31824 | 0.96 |
| ASBG11F | 0.38543 | 0.03273 | -0.18101 | 0.14828 | 1.03 |
| ASBG11G | -0.03872 | 0.28678 | 0.08095 | -0.36773 | 0.98 |
| ASBG11H | -0.44333 | 0.51278 | 0.34983 | -0.86261 | 0.97 |
| ASBG11I | -0.60515 | 0.67976 | 0.53743 | -1.21719 | 0.87 |
| ASBG11J | -0.73072 | 0.82778 | 0.68417 | -1.51195 | 0.93 |
| ASBG11K | -0.11594 | 0.45350 | -0.08114 | -0.37236 | 0.96 |

Scale Transformation Constants for the TIMSS 2019 Student Bullying Scale - Grade 4
Scale Transformation Constants
$\mathrm{A}=7.495914$
Transformed Scale Score $=7.495914+1.758100 \cdot$ Logit Scale Score

Equivalence Table of the Raw Score and Transformed Scale Scores for the TIMSS 2019 Student Bullying Scale - Grade 4

| Raw Score | Transformed Scale Score | Cutpoint |
| :---: | :---: | :---: |
| 0 | 2.86807 |  |
| 1 | 4.32091 |  |
| 2 | 4.88934 |  |
| 3 | 5.25172 |  |
| 4 | 5.52624 |  |
| 5 | 5.75084 |  |
| 6 | 5.94126 |  |
| 7 | 6.11702 |  |
| 8 | 6.27822 |  |
| 9 | 6.42850 |  |
| 10 | 6.57077 |  |
| 11 | 6.70718 |  |
| 12 | 6.83947 |  |
| 13 | 6.96901 |  |
| 14 | 7.09688 |  |
| 15 | 7.22397 |  |
| 16 | 7.35113 | 7.4 |
| 17 | 7.47839 |  |
| 18 | 7.60884 |  |
| 19 | 7.74099 |  |
| 20 | 7.87654 |  |
| 21 | 8.01658 |  |
| 22 | 8.16227 |  |
| 23 | 8.31512 |  |
| 24 | 8.47681 |  |
| 25 | 8.64712 |  |
| 26 | 8.83393 |  |
| 27 | 9.04042 |  |
| 28 | 9.27434 | 9.2 |
| 29 | 9.54836 |  |
| 30 | 9.88387 |  |
| 31 | 10.33461 |  |
| 32 | 11.04030 |  |

## Students Confident in Mathematics - Grade 4

## About the Scale

The Students Confident in Mathematics scale was created based on students' responses to nine items listed below.

ASBM05A T
ASBM05B ${ }^{\top}$
ASBM05C ${ }^{T}$
ASBM05D ${ }^{T}$
ASBM05E T
ASBM05F T
ASBM05G T
ASBM05H T

ASBM05I ${ }^{\top}$

2) Mathematics is harder for me than for many of my classmates ${ }^{\mathrm{R}}$----------------.
3) I am just not good at mathematics ${ }^{R}$------- -
4) I learn things quickly in mathematics -- - - - -
5) Mathematics makes me nervous ${ }^{R}$ $\qquad$
6) I am good at working out difficult mathematics problems -
7) My teacher tells me I am good at mathematics
8) Mathematics is harder for me than any

9) Mathematics makes me confused ${ }^{R}-\ldots-$ - - -

${ }^{R}$ Reverse coded
${ }^{\top}$ Trend item—item was included in the same scale in TIMSS 2015 and was used for linking the TIMSS 2015 and TIMSS 2019 scales.

Item Parameters for the TIMSS 2019 Students Confident in Mathematics Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |

Scale Transformation Constants for the TIMSS 2019 Students Confident in Mathematics Scale - Grade 4

## Scale Transformation Constants

$$
\begin{array}{cc}
A=8.556200 & \text { Transformed Scale Score }=8.556200+1.689256 \cdot \text { Logit Scale Score } \\
\hline B=1.689256 &
\end{array}
$$

Equivalence Table of the Raw Score and Transformed Scale Scores for the TIMSS 2019 Students Confident in Mathematics Scale - Grade 4

| Raw Score | Transformed Scale Score | Cutpoint |

## Students Confident in Science - Grade 4

## About the Scale

The Students Confident in Science scale was created based on students' responses to seven items listed below.

[^30]| Item Parameters for the TIMSS 2019 Students Confident in Science Scale - Grade 4 |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| ASBS09A | -0.44367 | -0.49754 | -0.58589 | 1.08343 | 1.00 |
| ASBS09B $R$ | 0.20303 | -0.59182 | 0.16393 | 0.42789 | 0.98 |

## Students Like Learning Science - Grade 4

## About the Scale

The Students Like Learning Science scale was created based on students' responses to nine items listed below.

[^33]| Item Parameters for the TIMSS 2019 Students Like Learning Science Scale - Grade 4 |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| ASBS07A | -0.12179 | -0.53434 | -0.49509 | 1.02943 | 0.81 |
| ASBS07B R | 0.51587 | -0.34763 | -0.09494 | 0.44257 | 1.55 |
| ASBS07C $R^{2}$ | 0.30062 | -0.44642 | -0.04532 | 0.49174 | 1.25 |

## Instruction Affected by Science Resource Shortages - Grade 4

## About the Scale

The Instruction Affected by Science Resource Shortages scale was created based on principals' responses to twelve items listed below.

[^37]Item Parameters for the TIMSS 2019 Instruction Affected by Science Resource Shortages Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| ACBG13AA | -0.26317 | -0.24640 | 0.07411 | 0.17229 | 0.96 |
| ACBG13AB | -0.49732 | -0.22859 | 0.20397 | 0.02462 | 0.89 |
| ACBG13AC | 0.00857 | -0.72314 | 0.13827 | 0.58487 | 1.07 |
| ACBG13AD | -0.24911 | -0.44652 | 0.18290 | 0.26362 | 0.95 |
| ACBG13AE | 0.04975 | -0.43752 | -0.01409 | 0.45161 | 1.08 |
| ACBG13AF | 0.05434 | -1.21339 | -0.05364 | 1.26703 | 0.97 |
| ACBG13AG | -0.02743 | -0.75072 | 0.03353 | 0.71719 | 0.97 |

## School Discipline - Grade 4

## About the Scale

The School Discipline scale was created based on principals' responses to ten items listed below.

[^38]Item Parameters for the TIMSS 2019 School Discipline Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| ACBG15A | -0.04835 | -2.12043 | -0.42165 | 2.54208 | 1.27 |
| ACBG15B | 0.28790 | -1.45910 | -0.51461 | 1.97371 | 1.22 |
| ACBG15C | 0.78849 | -2.13154 | -0.25288 | 2.38442 | 1.00 |
| ACBG15D | -0.50395 | -1.36108 | -0.70227 | 2.06335 | 1.07 |
| ACBG15E | 0.48418 | -1.65568 | -0.39478 | 2.05046 | 0.91 |
| ACBG15F | -0.31766 | -0.47898 | -0.62657 | 1.10555 | 0.86 |
| ACBG15G | -0.53958 | 0.31575 | -1.17406 | 0.85831 | 0.77 |
| ACBG15H | 0.21488 | -1.40063 | -0.58577 | 1.98640 | 0.94 |
| ACBG15I | 0.30591 | -1.40756 | -0.73711 | 2.14467 | 0.85 |
| ACBG15J | -0.67182 | 0.16233 | -0.91357 | 0.75124 | 0.87 |

Scale Transformation Constants for the TIMSS 2019 School Discipline Scale - Grade 4
Scale Transformation Constants
$\mathrm{A}=7.809340$
$B=0.952078$
Transformed Scale Score $=7.809340+0.952078 \cdot$ Logit Scale Score

Equivalence Table of the Raw Score and Transformed Scale Scores for the TIMSS 2019 School Discipline Scale - Grade 4

| Raw Score | Transformed Scale Score | Cutpoint |
| :---: | :---: | :---: |
| 0 | 3.70440 |  |
| 1 | 4.77250 |  |
| 2 | 5.27812 |  |
| 3 | 5.61661 |  |
| 4 | 5.87500 |  |
| 5 | 6.08629 |  |
| 6 | 6.26778 |  |
| 7 | 6.42945 |  |
| 8 | 6.57768 |  |
| 9 | 6.71549 |  |
| 10 | 6.84975 |  |
| 11 | 6.98118 |  |
| 12 | 7.11207 |  |
| 13 | 7.24453 |  |
| 14 | 7.38070 |  |
| 15 | 7.52341 | 7.6 |
| 16 | 7.67299 |  |
| 17 | 7.83372 |  |
| 18 | 8.00732 |  |
| 19 | 8.19660 |  |
| 20 | 8.40499 |  |
| 21 | 8.63392 |  |
| 22 | 8.88534 |  |
| 23 | 9.16002 |  |
| 24 | 9.45841 |  |

## School Emphasis on Academic SuccessPrincipals' Reports - Grade 4

## About the Scale

The School Emphasis on Academic Success scale was created based on principals' responses to eleven items listed below. ${ }^{1}$

ACBG14A T
ACBG14B T

ACBG14C ${ }^{\top}$
ACBG14D ${ }^{\top}$
ACBG14E ${ }^{\top}$
ACBG14F T
ACBG14G ${ }^{\top}$

ACBG14H ${ }^{\top}$
ACBG14I ${ }^{\top}$
ACBG14J T

ACBG14K ${ }^{\top}$

How would you characterize each of the following within your school?

[^39]Item Parameters for the TIMSS 2019 School Emphasis on Academic
Success—Principals' Reports Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| ACBG14A | -1.51453 | -3.71990 | 0.14195 | 3.57795 | 1.12 |
| ACBG14B | -1.06786 | -3.81822 | 0.14006 | 3.67816 | 0.98 |
| ACBG14C | -0.77174 | -3.36668 | -0.07105 | 3.43773 | 1.03 |
| ACBG14D | -0.86155 | -3.51615 | 0.09339 | 3.42276 | 1.03 |
| ACBG14E | 1.29590 | -2.49610 | 0.11848 | 2.37762 | 1.15 |

## Schools Where Students Enter with Literacy and Numeracy Skills - Grade 4

## About the Scale

The Schools Where Students Enter with Literacy and Numeracy Skills scale was created based on principals' responses to twelve items listed below.

[^40]Item Parameters for the TIMSS 2019 Schools Where Students Enter with Literacy and Numeracy Skills Scale - Grade 4

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| ACBG17A | -0.72531 | -1.60124 | 0.01778 | 1.58346 | 1.28 |
| ACBG17B | 0.28400 | -1.70182 | -0.01923 | 1.72105 | 1.14 |
| ACBG17C | 1.50852 | -1.39085 | -0.20204 | 1.59289 | 1.12 |
| ACBG17D | -0.58439 | -1.95844 | 0.18365 | 1.77479 | 1.16 |
| ACBG17E | -1.66731 | -1.47535 | 0.11321 | 1.36214 | 1.61 |
| ACBG17F | 0.54604 | -1.72628 | -0.06684 | 1.79312 | 0.97 |
| ACBG17G | 1.07922 | -1.89888 | -0.16212 | 2.06100 | 1.46 |
| ACBG17H | -1.89417 | -2.02701 | 0.38834 | 1.63867 | 1.15 |
| ACBG17I | 0.07560 | -1.89253 | -0.09470 | 1.98723 | 1.08 |
| ACBG17J | -0.88472 | -1.53692 | 0.16155 | 1.37537 | 1.08 |

## Scales Based on Teachers' Reports

## Classroom Teaching Limited by Students Not Ready for Instruction - Grade 4

## About the Scale

The Classroom Teaching Limited by Students Not Ready for Instruction scale was created based on teachers' responses to eight items listed below.

[^41]Item Parameters for the TIMSS 2019 Classroom Teaching Limited by Students Not Ready for Instruction Scale - Grade 4

| Item | delta | tau_1 | tau_2 | Infit |
| :--- | :---: | :---: | :---: | :---: |
| ATBG13A | 0.91125 | -2.07515 | 2.07515 | 1.04 |
| ATBG13B | -1.09075 | -1.07877 | 1.07877 | 1.08 |
| ATBG13C | -0.28607 | -1.55578 | 1.55578 | 0.96 |
| ATBG13D | -0.02520 | -1.59451 | 1.59451 | 1.00 |
| ATBG13E | 0.52548 | -1.39807 | 1.39807 | 0.97 |
| ATBG13F | 0.51002 | -1.82889 | 1.82889 | 0.94 |
| ATBG13G | -0.04183 | -1.36843 | 1.36843 | 1.02 |
| ATBG13H | -0.50290 | -1.21050 | 1.21050 | 1.05 |

Scale Transformation Constants for the TIMSS 2019 Classroom Teaching Limited by Students Not Ready for Instruction Scale - Grade 4

| Scale Transformation Constants |  | Transformed Scale Score $=8.854136+1.257770 \cdot$ Logit Scale Score |
| :--- | :--- | :--- |
| $B=8.854136$ |  |  |

Equivalence Table of the Raw Score and Transformed Scale Scores for the TIMSS 2019 Classroom Teaching Limited by Students Not Ready for Instruction Scale - Grade 4

| Raw Score | Transformed Scale <br> Score | Cutpoint |

## Teachers' Emphasis on Science Investigation - Grade 4

## About the Scale

The Teachers' Emphasis on Science Investigation scale was created based on teachers' responses to eight items listed below. ${ }^{1}$

${ }^{1}$ For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Some lessons" and "Never" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.
${ }^{\top}$ Trend item-item was included in the same scale in TIMSS 2015 and was used for linking the TIMSS 2015 and TIMSS 2019 scales.

## Teachers' Job Satisfaction - Grade 4

## About the Scale

The Teachers' Job Satisfaction scale was created based on students' responses to five items listed below. ${ }^{1}$

${ }^{1}$ For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Sometimes" and "Never or almost never" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.
${ }^{\top}$ Trend item-item was included in the same scale in TIMSS 2015 and was used for linking the TIMSS 2015 and TIMSS 2019 scales.

## Appendix 16B: TIMSS 2019 Context Questionnaire Scales—Grade 8

## Scales Based on Students' Reports

## Disorderly Behavior During Mathematics Lessons - Grade 8

## About the Scale

The Disorderly Behavior During Mathematics Lessons scale was created based on students' responses to six items listed below.

BSBM18A
How often do these things happen in your mathematics lessons?

BSBM18B
BSBM18C
BSBM18D
BSBM18E
BSBM18F

Item Parameters for the TIMSS 2019 Disorderly Behavior During Mathematics Lessons Scale

## Home Educational Resources - Grade 8

## About the Scale

The Home Educational Resources scale was created based on students' reports regarding the availability of three resources listed below.

[^44]Item Parameters for the TIMSS 2019 Home Educational Resources Scale - Grade 8

| Item | delta | tau_1 | tau_2 | tau_3 | tau_4 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |

## Student Bullying - Grade 8

## About the Scale

The Student Bullying scale was created based on students' responses to fourteen items listed below.

BSBG14A
BSBG14B
BSBG14C
BSBG14D
BSBG14E
BSBG14F
BSBG14G
BSBG14H
BSBG14I
BSBG14J
BSBG14K
BSBG14L
BSBG14M
BSBG14N

During this school year, how often have other students from your school done any of the following things to you, including through texting or the Internet?

Item Parameters for the TIMSS 2019 Student Bullying Scale - Grade 8

| Item | delta | tau_1 | tau_2 | tau_3 |
| :--- | :---: | :---: | :---: | :---: |
| BSBG14A | 0.71305 | 0.04645 | -0.26859 | 0.22214 |

## Students Confident in Biology - Grade 8

## About the Scale

The Students Confident in Biology scale was created based on students' responses to eight items listed below.

BSBB25A
BSBB25B

BSBB25C
BSBB25D
BSBB25E

BSBB25F
BSBB25G
BSBB25H

How much do you agree with these statements about biology?

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :---: | :---: | :---: | :---: | :---: | :---: |

${ }^{R}$ Reverse coded
Relationship Between the TIMSS 2019 Students Confident in Earth Science Scale and TIMSS 2019 Achievement - Grade 8

## Students Confident in Mathematics - Grade 8

## About the Scale

The Students Confident in Mathematics scale was created based on students' responses to nine items listed below.

BSBM19A T
BSBM19B T
BSBM19C T
BSBM19D ${ }^{\top}$
BSBM19E ${ }^{\top}$
BSBM19F T
BSBM19G ${ }^{\top}$
BSBM19H T
$B^{B S B M 19 I}{ }^{\top}$

How much do you agree with these statements about mathematics?

${ }^{\top}$ Trend item-item was included in the same scale in TIMSS 2015 and was used for linking the TIMSS 2015 and TIMSS 2019 scales.

## Students Value Science - Grade 8

## About the Scale

The Students Value Science scale was created based on students' responses to nine items listed below.

[^60]Item Parameters for the TIMSS 2019 Students Value Science Scale - Grade 8

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| BSBS25A | -0.54895 | -1.70374 | -0.44149 | 2.14523 | 1.15 |
| BSBS25B | 0.21327 | -2.19431 | -0.06708 | 2.26139 | 1.21 |
| BSBS25C | -0.00218 | -1.78502 | -0.01869 | 1.80371 | 0.91 |

## Instruction Affected by Mathematics Resource Shortages - Grade 8

## About the Scale

The Instruction Affected by Mathematics Resource Shortages scale was created based on principals' responses to thirteen items listed below.

${ }^{\top}$ Trend item—item was included in the same scale in TIMSS 2015 and was used for linking the TIMSS 2015 and TIMSS 2019 scales.

Item Parameters for the TIMSS 2019 Instruction Affected by Mathematics

## Instruction Affected by Science Resource Shortages - Grade 8

## About the Scale

The Instruction Affected by Science Resource Shortages scale was created based on students' responses to thirteen items listed below.

[^61]Item Parameters for the TIMSS 2019 Instruction Affected by Science Resource Shortages Scale - Grade 8

| Item | delta | tau_1 | tau_2 | tau_3 | Infit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| BCBG13AA | -0.11528 | -0.33350 | 0.01422 | 0.31928 | 0.92 |
| BCBG13AB | -0.35173 | -0.34117 | 0.24349 | 0.09768 | 0.92 |
| BCBG13AC | 0.22227 | -0.79974 | 0.05530 | 0.74444 | 1.07 |
| BCBG13AD | -0.10888 | -0.67368 | 0.03847 | 0.63521 | 1.12 |

## Classroom Teaching Limited by Students Not Ready for Instruction - Grade 8

## About the Scale

The Classroom Teaching Limited by Students Not Ready for Instruction scale was created based on teachers' responses to eight items listed below.

[^64]Item Parameters for the TIMSS 2019 Classroom Teaching Limited by Students Not Ready for Instruction Scale - Grade 8

| Item | delta | tau_1 | tau_2 | Infit |
| :--- | :---: | :---: | :---: | :---: |
| BTBG13A | 1.09871 | -1.88960 | 1.88960 | 1.02 |

## Teachers' Emphasis on Science Investigation - Grade 8

## About the Scale

The Teachers' Emphasis on Science Investigation scale was created based on teachers' responses to eight items listed below.

${ }^{1}$ For the purpose of scaling, categories in which there were very few respondents were combined. The categories "Some lessons" and "Never" were combined for all variables. The scale statistics that are reported herein reflect analysis of the items following collapsing.
${ }^{\top}$ Trend item-item was included in the same scale in TIMSS 2015 and was used for linking the TIMSS 2015 and TIMSS 2019 scales.

[^0]:    1 The TIMSS achievement scales were established in 1995 based on the combined achievement distribution of all countries that participated in TIMSS 1995, at each grade level. To provide a point of reference for country comparisons, the scale centerpoint of 500 was located at the mean of the combined achievement distribution. The scale units were chosen so that 100 scale score points corresponded to the standard deviation of the distribution. Accordingly, one standard deviation unit is approximately 100 scale score points.

[^1]:    1 Counts may be inconsistent with Exhibits 5.1, 5.2, and 5.3 due to omission of benchmarking entities that share instruments with the national country participant and did not require additional translation and layout verification.

[^2]:    1 Canada only participated at Grade 8 in the benchmarking regions of Ontario and Quebec.

[^3]:    1 WinW3S is a software developed by IEA Hamburg that stores participation information at school, teacher, class, and student levels in a relational database while maintaining a hierarchical ID system. The software allows users to perform all necessary within-school sampling according to the TIMSS standards, and also provides some data validation in and across these levels.

[^4]:    2 After school-level exclusions.

[^5]:    TIMSS guidelines for sampling participation: The minimum acceptable participation rates were 85 percent of both schools and students, or a combined rate (the product of school and student participation) of 75 percent.
    Participants not meeting these guidelines were annotated as follows:
    $\dagger$ Met guidelines for sample participation rates only after replacement schools were included
    $\ddagger$ Nearly satisfied guidelines for sample participation rates after replacement schools were included
    $\equiv$ Did not satisfy guidelines for sample participation rates

[^6]:    TIMSS guidelines for sampling participation: The minimum acceptable participation rates were 85 percent of both schools and students, or a combined rate (the product of school and student participation) of 75 percent.
    Participants not meeting these guidelines were annotated as follows:
    $\dagger$ Met guidelines for sample participation rates only after replacement schools were included
    $\ddagger$ Nearly satisfied guidelines for sample participation rates after replacement schools were included
    $\equiv$ Did not satisfy guidelines for sample participation rates

[^7]:    * Certainty regions

[^8]:    * Certainty regions

[^9]:    1 Two fourth grade mathematics items involving an on-screen ruler tool were only included in the eTIMSS assessment. Forty-eight fourth grade mathematics items were also included in the less difficult version of the assessment.

[^10]:    2 For computing point-biserial correlations, the total score is the percentage of points a student has scored on the items they were administered. In the context of TIMSS, a separate total score is computed for mathematics and for science. Not-reached responses are not included in the total score.

[^11]:    Items beginning with "ME" are eTIMSS items. Items beginning with "MP" are paperTIMSS items, or bridge items. paperTIMSS trend items deleted or recoded for all countries were also modified for eTIMSS bridge samples.

[^12]:    1 The writeup of the psychometric methods presented in this chapter has many sources and the models presented here were developed by a variety of authors. The presentation as compiled here is focused on TIMSS 2019 and benefited greatly from conversations with, and reviews and proofreading by Michael O. Martin, Pierre Foy, Bethany Fishbein, and Liqun Yin.

[^13]:    Linking error is the standard error associated with the difference. Standard errors are shown in parentheses.

[^14]:    Linking error is the standard error associated with the difference. Standard errors are shown in parentheses.

[^15]:    Linking error is the standard error associated with the difference. Standard errors are shown in parentheses.

[^16]:    4 The bridge item parameters are not presented in these Appendices since they were identical to the item parameters shown in Appendices 12A through 12D, respectively, for paperTIMSS trend items.

[^17]:    * Item parameters for trend items were fixed from the paperTIMSS fourth grade science concurrent calibration.

[^18]:    * Item parameters for trend items were fixed from the paperTIMSS fourth grade science concurrent calibration.

[^19]:    * Item parameters for trend items were fixed from the paperTIMSS fourth grade science concurrent calibration.

[^20]:    * Invariant item-item parameters for invariant items were fixed from the paperTIMSS concurrent calibration; location parameters are transformations of the fixed paperTIMSS value.

[^21]:    * Invariant item-item parameters for invariant items were fixed from the paperTIMSS concurrent calibration; location parameters are transformations of the fixed paperTIMSS value.

[^22]:    1 When schools were sampled, they were ordered within explicit strata by implicit stratification variables and their measure of size. Based on this sorting, successively sampled schools had similar stratification attributes. More information can be found in Appendix 3A of Chapter 3.
    2 If a remaining school consisted of 2 sampled classrooms, each classroom became a "quasi" school.
    3 The randomization used in the resampling within sampling zones preserves the sampling variance measured in the original sampling zones after collapsing.
    4 Note that jackknife sampling zones may be constructed in a different manner under specific national conditions. Country-specific information on the construction of Jackknife sampling zones is available in Appendix 9A of Chapter 9.

[^23]:    Items beginning with " N " are items unique to less difficult mathematics.

[^24]:    1 The reason for rounding was to facilitate reporting, and it was decided that the highest cutpoint would be rounded down to ensure that those with an unrounded scale score (e.g., 10.38390 for the Instructional Clarity scale) at the cutpoint were included within the highest region. For a similar reason, the lower cutpoint was rounded up.
